MANIFESTING BIPOLARITY IN MULTI-OBJECTIVE FLEXIBLE LINEAR PROGRAMMING

by

DIPTI DUBEY

Department of Mathematics

submitted

*in fulfillment of the requirements of the degree of
Doctor of Philosophy*

to the

Indian Institute of Technology Delhi

August 2013

Certificate

This is to certify that the thesis entitled “**Manifesting Bipolarity in Multi-objective Flexible Linear Programming**” submitted by **Ms. Dipti Dubey** to the Indian Institute of Technology Delhi, for the award of the Degree of Doctor of Philosophy, is a record of the original bona fide research work carried out by her under my supervision and guidance. The thesis has reached the standards fulfilling the requirements of the regulations relating to the degree.

The results contained in this thesis have not been submitted in part or full to any other university or institute for the award of any degree or diploma.

Dr. Aparna Mehra

Associate Professor

Department of Mathematics

Indian Institute of Technology Delhi

New Delhi 110 016

August 2013

Acknowledgements

The happiness of success lies in sharing it with all those who have helped and inspired me to achieve it. I would like to express my gratitude to all people whose constant guidance and encouragement served as a beacon of light. I would like to thank Prof. Suresh Chandra for his invaluable advise at every critical juncture of my academic and personal life during the course of Ph.D. work. I will forever be thankful to him for his constant encouragement, care and most importantly, teaching me how to live a life of gratitude. His blessings are always precious.

I feel privileged to express my heartiest thanks and gratitude to my supervisor Dr. Aparna Mehra for giving me the opportunity to conduct research under her guidance and keeping faith in my caliber throughout the Ph.D. work. I will always be indebted to her for affectionate support and care she provided me academically and personally.

I am thankful to IIT Delhi authorities for providing me the necessary facilities for the smooth completion of my work. I would like to give special thanks to my S.R.C. (Student Research Committee) members: Prof. R. K. Sharma, Prof. Niladri Chatterjee, Prof. D. K. Banwet for their valuable time and suggestions. Prof. B.S. Panda, Head of the Department, Prof. R.K.Sharma and Prof. Anshul Kumar, former Heads of the Department for their support.

I express my gratitude to all the faculty members and staff of the Department of Mathematics, IIT Delhi, for their encouragement. Specifically, I owe a special thank to Dr. Anima Nagar to mentor my initial year of Ph.D. which build strong foundation that in turn helped me to excel along the way.

I would like to convey my sincere thanks to Prof. Bernard De Baets and Dr. Glad Deschrijver, University of Ghent, Belgium for their valuable feedbacks and enriching suggestions. I truly appreciate Dr. Balasubramaniam Jayaraman, IIT Hyderabad, Dr. C. S. Lalitha and Dr. Pankaj Gupta, Delhi University, for their positive encouragements, boosting my morale, during this period.

Also I would like to thank the National Board of Higher Mathematics for providing me financial assistance by awarding me research fellowship for my Ph. D. research work. I would also like to thank the anonymous reviewers and editors of our papers for their enriching suggestions which motivated us to look into areas which we never thought of venturing into.

Many thanks to Dr. Abha Aggarwal, Dr. Anulekha Dhara, and Dr. Anjana Gupta for their love, unending encouragement, and support. It appears almost impossible to thank each one of my friends individually, but I would like them to know that the happy memories of my friendship with them always remain in the deepest corner of my heart. I would particularly like to thank: Ram, Resham, Ratikant, Amit, Suvo, Kavita, Amita and Arti for their lovely company, help, and concern.

Above all, no words are enough to pay my gratitude to my family. I would like to express my deepest gratitude to my beloved and respected parents for their priceless love, sacrifice, care, dedication, encouragement, and virtually for everything. A special thanks to my brother Rajeev, sister Rashmi, brother in law Dr. Ashok Udenia, and my sweetest adorable nephew Vinamra, for being very caring and supportive.

Abstract

Linear programming (LP) traditionally works with hard constraints, but in many circumstances flexible version of constraints may be beneficial when specifying strict satisfaction of constraints leads to inconsistencies resulting in the vacuousness of the feasible set. A flexible linear program (FLP) may be of great help in such situations. Moreover, if there are more than one objective functions to be optimized simultaneously in an FLP problem then it is termed as a multi-objective FLP (MOFLP) problem. The MOFLP problems are often investigated under the name fuzzy multi-objective linear programming because fuzzy sets are used as principal tool to mathematically represent flexible constraints.

The traditional framework for MOFLP problems is inspired by the max-min approach proposed by Zimmermann. This approach consists of mainly two steps. In the first step objective functions are transformed into the flexible constraints using aspiration levels. In the second step the fuzzy sets representing the flexible constraints corresponding to the objective functions and the original flexible constraints of MOFLP are aggregated together to define the decision set.

In this thesis, we propose an alternative approach to model MOFLP from a perspective of heterogeneous bipolar view in preference modeling. The flexible constraints in a MOFLP are viewed as negative preferences for describing what is somewhat tolerable while the flexible constraints corresponding to the objective functions of the problem are viewed as positive preferences for depicting satisfaction to what is desirable. This viewpoint enables us to handle fuzzy sets representing constraints and objective functions separately and combine them in distinct ways. After aggregating these fuzzy sets separately, the coherence (or consistency) condition is used to define the ultimate decision set and a new ‘bipolar approach’ is proposed to solve MOFLP problems.

This bipolar approach is further extended to multi-objective flexible linear programming with interval uncertainty (MOFLPIU). A flexible constraint with interval

uncertainty extends the flexible constraint by allowing preferences to be expressed in the form of intervals. In order to accomplish this aim, in the first place, we study flexible linear programming with interval uncertainty (FLPIU). Using mathematical equivalence of interval-valued fuzzy set and Attanasov's intuitionistic fuzzy set (I-fuzzy set), interval uncertainty in a flexible constraint is expressed mathematically using an I-fuzzy set. According to construction of non-membership function, three different viewpoints viz., optimistic, pessimistic, and mixed, are proposed to interpret an interval uncertainty. The solution methods are proposed to solve FLPIU by associating fuzzy sets with each I-fuzzy set representing flexible constraints with interval uncertainty. Afterwards we study MOFLPIU and integrate the heterogeneous bipolarity in it. We propose an optimistic-pessimistic approach to solve MOFLPIU using an interval-valued fuzzy set representation and the Hurwicz optimism-pessimism criterion.

Finally in this thesis, we define a solution concept of Pareto-optimality for MOFLP problems. An approach is proposed to single out such a solution for MOFLP with highest possible degree of feasibility in the bipolar framework. The bipolar approach to solve MOFLP is restudied with consideration to this solution concept and an approach is proposed to extract Pareto-optimal solution from the set of optimal solutions of its deterministic equivalent optimization problem. The solution concept of Pareto-optimality is also extended to MOFLPIU problems in such a way that a Pareto-optimal solution of MOFLPIU can be obtained using the approach proposed to extract the Pareto-optimal solution of MOFLP.
