

REDUCED ORDER MODELLING AND FAST SIMULATION STRATEGIES FOR NONLINEAR DYNAMICAL SYSTEMS

by

SHAHKAR AHMAD NAHVI

DEPARTMENT OF ELECTRICAL ENGINEERING

Submitted

in fulfilment of the requirements of the degree of

Doctor of Philosophy

to the

INDIAN INSTITUTE OF TECHNOLOGY DELHI

NOVEMBER 2012

Certificate

This is to certify that the thesis entitled “**Reduced Order Modelling and Fast Simulation Strategies for Nonlinear Dynamical Systems**”, submitted by **Shahkar Ahmad Nahvi** to the Indian Institute of Technology Delhi, for the award of the degree of Doctor in Philosophy in Electrical Engineering, is a record of the original, bona fide research work carried out by him under our supervision and guidance. The thesis has reached the standards fulfilling the requirements of the regulations related to the award of the degree.

The results contained in this thesis have not been submitted in part or in full to any other university or institute for the award of any degree or diploma.

Dr. Mashuq-un-Nabi

Department of Electrical Engineering,
Indian Institute of Technology Delhi.

Dr. S. Janardhanan

Department of Electrical Engineering,
Indian Institute of Technology Delhi.

Acknowledgements

This work would not have been possible without the guidance, wise-counsel and patience of my teachers, Dr. M. Nabi and Dr. Janardhanan. I thank them for all their help through this phase of my life.

I am especially grateful to Abid bhai, who has been the best colleague-friend-teacher combination that I could have asked for.

I thank my family for their sacrifices and for bearing with me, this work is perhaps more a fruit of their efforts than of mine.

And special thanks to **Ha-Meem** for coming into this world, and learning during this period things far more difficult than Nonlinear model reduction.

Shahkar

Abstract

Dynamical systems are used to model diverse physical and artificial processes. Realistic and accurate description of many such systems tends to be of large dimensions, and their simulation is not possible without expenditure of considerable amounts of computational resources and time. Approximation is thus crucial for cost-effective simulation. Model order reduction (MOR) techniques help realize this objective in a computationally efficient way. They result in a dimensionally reduced system with input-output mapping similar to the large system being approximated.

MOR methods for large Linear time invariant systems are well researched and have been extensively covered in literature. Many such techniques have been extended to nonlinear systems, but research in nonlinear model reduction is in its infancy. Though strongly motivated and having a broad scope of applications, nonlinear model reduction also poses a different set of problems to be solved. This thesis represents an effort in developing better reduced order modelling techniques for nonlinear dynamical systems.

The focus in this thesis is on two popular techniques for nonlinear model reduction, Proper Orthogonal Decomposition (POD) and the Trajectory piece-wise linear (TPWL) approximation. It aims at improving the applicability and computational performance of these strategies and the approximation qualities and robustness of the reduced-order models obtained using them.

Although TPWL is a popular and widely applied tool for nonlinear model reduction, recent works have shown that TPWL models can under-perform for some applications. Questions have also been raised about the heuristic choices to be made during the course of the TPWL procedure. The endeavour in this work is to study the efficacy of the TPWL approximation, and this involves investigating the implicit assumptions, the dependence on heuristics and the applicability of

the TPWL method. Another point of focus is the method of basis extraction in POD, which constitutes a significant part of the total computational cost of the model reduction procedure.

In TPWL, in the offline stage, linearisations on the nonlinear system trajectory are done and stored. A superposition strategy interacts with this database to approximate the nonlinear system dynamics in the online phase. In this thesis, new methods are introduced to improve both these stages of the TPWL procedure. For linearisation point selection, new strategies that seek to address the important concerns regarding previously reported methods are proposed and validated. For the online phase, a new strategy is proposed for improving the superposition of linear systems in TPWL. A separate issue investigated in TPWL is its applicability to a wider class of nonlinear systems, the issues arising out of which are analysed, and in the process, a new method for nonlinear model reduction is introduced. Finally, a new alternative to extract basis functions for POD is illustrated and it is shown that the need for computationally heavy, a-priori simulations of the nonlinear system can be circumvented.

The organisation of this thesis is as follows, Chapter-1 consists of the introduction to the thesis, it explains the motivation and builds the background for the subsequent chapters. Chapter-2 contains a review of important works in the field of MOR, with emphasis on nonlinear dynamical systems. Chapter-3 deals with the issue of linearisation point selection in TPWL. Chapter-4 investigates the limitations of conventional superposition schemes in TPWL and in Chapter-5 the applicability of TPWL to more general nonlinear systems is analysed. Chapter-6 deals with POD and proposes the strategy to reduce the computational costs of the POD procedure. Finally, in the last chapter a summary of the thesis is presented and future directions of research are identified.

Contents

Abbreviations and Nomenclature	xiii
1 Introduction	1
1.1 Motivation	1
1.2 Objectives	2
1.3 Background and scope of work	3
1.3.1 Issues considered in TPWL	3
1.3.2 Issue considered in POD	6
1.4 Brief summary of contribution	6
1.5 Chapter outline	7
2 Literature Survey	9
2.1 MOR: objectives and application to LTI systems	9
2.2 MOR of nonlinear dynamical systems	12
2.2.1 Proper orthogonal decomposition	14
2.2.2 The Trajectory piecewise linear approximation	16
2.2.3 Summary of problems identified in TPWL	23
2.3 Conclusion	24
3 Selection of linearisation points in TPWL	25
3.1 Mathematical formulation of the TPWL method	26
3.2 Previous methods used for LP selection	28
3.2.1 LP selection by uniform trajectory division	28

3.2.2	LP selection by comparing responses	32
3.2.3	Other methods	34
3.3	A new error-index	35
3.4	Adaptive Fast Approximate Simulation	39
3.4.1	Numerical Validation	42
3.4.2	Remarks	47
3.5	Fast Simulation with Error Assessment	49
3.5.1	Numerical Validation	51
3.5.2	Remarks	56
3.6	Conclusion	57
4	Effective superposition of sub-models in TPWL	59
4.1	Limitations of the conventional weight assignment approach	60
4.2	Nonlinearity-aware TPWL	62
4.2.1	Dynamics inspired weight-assignment	62
4.2.2	Composite participation measure	64
4.2.3	Evaluating $\hat{f}(x)$	65
4.3	Overall MOR strategy using NTPWL	66
4.4	Case studies	68
4.4.1	Case-1: Nonlinear transmission line model	68
4.4.2	Case-2: RC ladder circuit	72
4.4.3	Improved robustness	73
4.5	Conclusion	75
5	The Trajectory piece-wise quasi-linear method	77
5.1	Trajectory based methods for general nonlinear systems	78
5.1.1	The TPWQ formulation	80
5.1.2	An example to motivate quasi-linearisation	81
5.2	Cost effective simulation of quasilinear systems	85
5.3	Numerical validation	91

5.3.1	TPWL and TPWQ formulations of the circuit	92
5.3.2	Results	95
5.4	Conclusion	101
6	Reduction of basis extraction time in POD	103
6.1	Review of POD	105
6.2	Peculiarities of simulating large nonlinear systems	106
6.3	Approximate snapshot-ensemble generation and basis extraction . .	107
6.4	Numerical validation	109
6.5	Conclusion	115
7	Summary and conclusions	117
7.1	Summary of contribution	117
7.2	Scope for future work	118
7.2.1	Extension of developed strategies to other problems	118
7.2.2	Specific modifications possible	119
7.2.3	Other possible improvements in TPWL	120
	Bibliography	123
A	Detailed description of nonlinear models	133
A.1	Nonlinear transmission line	133
A.2	RC ladder circuit	134
A.3	MEMS model	134
A.4	Inverter Circuit	135
