DEDICATED TO MY PARENTS

CERTIFICATE

This to certify that the thesis entitled, “**Modeling and Simulation in the field of Environmental and Air Pollution Abatement; Special emphasis on Catalytic Converters**”, being submitted by **Ms Sanchita Chauhan** to Indian Institute of Technology, New Delhi, for the award of degree of Doctor of Philosophy is a record of bonafide research work carried out by her. She has worked under my guidance and supervision and has fulfilled the requirements for the submission of this thesis, which to my knowledge has reached the requisite standard.

The results contained in the thesis have not been submitted, in part or full, to any other university or institute for the award of any degree or diploma.

Prof. V.K. Srivastava,
Dean I.R.D. and Professor,
Chemical Engineering Department
Indian Institute of Technology,
New Delhi – 110 016

ACKNOWLEDGEMENTS

I would like to use this unique opportunity to thank my guide Professor V.K. Srivastava, Dean Industrial Research and Development, and Professor of Chemical Engineering, Indian Institute of Technology, New Delhi for sowing and nurturing this Ph.D Research work. I acknowledge my gratitude for his valuable advice and constant supervision and support. The keen interest shown by him with unfailing patience and indefatigability has been a source of inspiration to me and has enabled me to bring this work to a successful completion, which may not otherwise have been possible.

I am highly indebted to Prof. A. K. Gupta, Head, Department of Chemical Engineering for his encouragement and valuable advice.

Deep gratitude is expressed to Prof. K. D. P. Nigam, Department of Chemical Engineering for his support and help, extended during this period of research.

I am profoundly thankful to all the faculty members of Department of Chemical Engineering, especially Prof B. K. Guha, Dr. A. N. Bhaskarwar and Dr. K. K. Pant for their encouragement and valuable suggestions regarding this work.

I would also express my gratitude to Prof. H. M. Chawla, Head Department of Chemistry, for his encouragement during the progress of this work.

I would like to thank Mr. K. P. Singh, Assistant Registrar (P.G Section) for his kind support.

I would like to thank Mr. N. K. Gupta of Chemical Engineering Department and Mrs Neelan, of IRD Section for their help. The invaluable assistance of Mr. Jagdish Chand of IRD Section, is greatly acknowledged.

Dated: 18 June, 2003

New Delhi.

(Sanchita Chauhan)

ABSTRACT

This thesis concerns Modeling of Automotive Catalysts for the purpose of controlling tail-pipe emissions. The work focuses on development of a model capable of simulating various components present in exhaust gas after-treatment system during cold start. The model developed was a simple model that could give fast and reasonably satisfactory results for species conversion and simulates both for the thermal transient and the steady state conversion for the desired species.

Keeping this as the objective a transient model to simulate for both thermal and conversion characteristics of adiabatic monolith converter operating under warm-up conditions was made. The transient response of the catalytic converter for hydrocarbon systems during cold-start period in the converter was analysed. During this warm-up period when the engine has just started, the catalyst is at the ambient temperature (i.e., has the same temperature as the surroundings), usually in the range of -20°C to 45°C depending upon the climatic conditions of the place.

For the reactions to get initiated on the catalyst surface the catalyst requires pre-heating to a temperature of about 250-300°C. During a normal operation the incoming hot exhaust gas pre-heats the catalyst till the later achieves its operational temperature commonly referred to as the light-off temperature (is a measure of activity and is normally defined as the temperature at which 50% conversion of pollutants is achieved). This catalyst warming-up process takes about 1-2 min and during this time as much as 60-80% of the total hydrocarbon emission occurs. Solution to this problem is still under development.

Improvement of design requires fundamental understanding of the complex processes taking place in the converter involving fluid flow, heat and mass transfer and chemical reactions. The design improvements also require in addition to experimental testing (which is very expensive), an ability to numerically simulate the models and predict the converter performance.

Hydrocarbon composition in the exhaust is a function of the engine temperature and operating conditions. With conventional analysers it is not possible to have time dependent information about the activity of different hydrocarbons present in the exhaust [Koltsakis et al., 1997]. So a rough approximation is made in such computations. Initially single fast oxidising hydrocarbon propylene was considered

representing the total hydrocarbons and later another relatively slow oxidising hydrocarbon propane was added to see the combined effect on the system. Both homogenous as well as catalytic reaction terms are accounted for in the mass and energy balance equations for the gas as well as the solid phase. The variations in gas concentration, gas temperature and solid temperature along the length of the converter with respect to time are determined.

For gas concentration and gas temperature the equations are ordinary differential equations of first order and for the catalyst temperature the equation is partial differential. All these equations are coupled, representing a quasi steady-state system and their solutions are interdependent. The ordinary differential equations are solved by Runge-Kutta method of fourth order and the partial differential equation is solved using Backward Implicit Scheme. Also the effect of changes in various parameters like inlet gas temperature, catalyst loading, cell density, initial solid temperature, and concentration of the reactant etc on conversion of the reactant gas was studied.

Comparison of modeling for two-gas system using a quasi steady-state system was made with results later derived for unsteady state system. In the former case as already stated a combination of three ordinary differential equations and one partial differential equation

represented the system and in the later case of unsteady state system four partial differential equations, representing the gas phase concentrations, temperature and solid temperature respectively was considered.

Nitrogen oxide engine-out emissions during cold start are not considered as it has been reported that these emissions are very low for engine operating at low loads. Also due to high hydrocarbon emission rates at cold start, the effect of carbon monoxide emissions is also neglected in the present work.

As only warm-up of the converter is being considered, model analysis providing exhaust gas composition averaged over distinct driving operation modes (idling, acceleration, constant speed and deceleration) is not taken into account for modeling purpose.

ALONG THE LENGTH WITH RESPECT TO TIME FOR A
MIXTURE OF PROPYLENE (1900ppm) AND PROPANE
(950ppm) EXHAUSTS ENTERING TOGETHER AT 390°C
FOR CATALYTIC REACTIONS ONLY.

- 6.27 COMPARISON OF CONCENTRATION VARIATION OF 388
PROPANE ALONG THE LENGTH WITH RESPECT TO
TIME FOR A MIXTURE OF PROPYLENE (4000ppm) AND
PROPANE (2000ppm) EXHAUSTS ENTERING TOGETHER
AT 900°C FOR BOTH THE CATALYTIC REACTIONS
ONLY AND CATALYTIC-HOMOGENOUS REACTIONS.
- 6.28 COMPARISON OF CONCENTRATION VARIATION OF 389
PROPANE ALONG THE LENGTH WITH RESPECT TO
TIME FOR A MIXTURE OF PROPYLENE (6000ppm) AND
PROPANE (3000ppm) EXHAUSTS ENTERING TOGETHER
AT 900°C FOR BOTH THE CATALYTIC REACTIONS
ONLY AND CATALYTIC-HOMOGENOUS REACTIONS.
- 6.29 COMPARISON OF CONCENTRATION VARIATION OF 390
PROPYLENE ALONG THE LENGTH WITH RESPECT TO
TIME FOR A MIXTURE OF PROPYLENE (6000ppm) AND
PROPANE (3000ppm) EXHAUSTS ENTERING TOGETHER
AT 900°C FOR BOTH THE CATALYTIC REACTIONS
ONLY AND CATALYTIC-HOMOGENOUS REACTIONS.
- 6.30 COMPARISON OF GAS TEMPERATURE VARIATION 390
ALONG THE LENGTH WITH RESPECT TO TIME FOR A

MIXTURE OF PROPYLENE (6000ppm) AND PROPANE (3000ppm) EXHAUSTS ENTERING TOGETHER AT 900°C FOR BOTH THE CATALYTIC REACTIONS ONLY AND CATALYTIC-HOMOGENOUS REACTIONS.

- 6.31 COMPARISON OF SOLID TEMPERATURE VARIATION 391
ALONG THE LENGTH WITH RESPECT TO TIME FOR A
MIXTURE OF PROPYLENE (6000ppm) AND PROPANE
(3000ppm) EXHAUSTS ENTERING TOGETHER AT 900°C
FOR BOTH THE CATALYTIC REACTIONS ONLY AND
CATALYTIC-HOMOGENOUS REACTIONS.
- 6.32 COMPARISON OF CONCENTRATION VARIATION OF 392
PROPANE ALONG THE LENGTH WITH RESPECT TO
TIME FOR A MIXTURE OF PROPYLENE (6000ppm) AND
PROPANE (3000ppm) EXHAUSTS ENTERING TOGETHER
AT 1000°C FOR BOTH THE CATALYTIC REACTIONS
ONLY AND CATALYTIC-HOMOGENOUS REACTIONS.
- 6.33 COMPARISON OF CONCENTRATION VARIATION OF 393
PROPYLENE ALONG THE LENGTH WITH RESPECT TO
TIME FOR A MIXTURE OF PROPYLENE (6000ppm) AND
PROPANE (3000ppm) EXHAUSTS ENTERING AT 1000°C
FOR BOTH THE CATALYTIC REACTIONS ONLY AND

CATALYTIC-HOMOGENOUS REACTIONS.

- 6.34 COMPARISON OF CONCENTRATION OF PROPYLENE 394
ALONG THE LENGTH WITH RESPECT TO TIME FOR
SOLUTIONS OBTAINED USING TWO TYPES OF
MODELS (1) QUASI STEADY STATE CONDITIONS AND
(2) UNSTEADY STATE CONDITIONS FOR A MIXTURE
OF PROPYLENE (1900ppm) AND PROPANE (950 ppm)
EXHAUSTS ENTERING AT 390°C.
- 6.35 COMPARISON OF CONCENTRATION OF PROPANE 395
ALONG THE LENGTH WITH RESPECT TO TIME FOR
SOLUTIONS OBTAINED USING TWO TYPES OF
MODELS (1) QUASI STEADY STATE CONDITIONS AND
(2) UNSTEADY STATE CONDITIONS FOR A MIXTURE
OF PROPYLENE (1900ppm) AND PROPANE (950 ppm)
EXHAUSTS ENTERING AT 390°C.
- 6.36 COMPARISON OF GAS TEMPERATURE ALONG THE 396
LENGTH WITH RESPECT TO TIME FOR SOLUTIONS
OBTAINED USING TWO TYPES OF MODELS (1) QUASI
STEADY STATE CONDITIONS AND (2) UNSTEADY
STATE CONDITIONS FOR A MIXTURE OF PROPYLENE
(1900ppm) AND PROPANE (950ppm) EXHAUSTS

ENTERING AT 390°C.

6.37 COMPARISON OF SOLID TEMPERATURE ALONG THE 397
LENGTH WITH RESPECT TO TIME FOR SOLUTIONS
OBTAINED USING TWO TYPES OF MODELS (1) QUASI
STEADY STATE CONDITIONS AND (2) UNSTEADY
STATE CONDITIONS FOR A MIXTURE OF PROPYLENE
(1900ppm) AND PROPANE (950ppm) EXHAUSTS
ENTERING AT 390°C.

6.38 COMPARISON OF GAS CONCENTRATIONS, GAS AND 398
SOLID TEMPERATURES ALONG THE LENGTH WITH
RESPECT TO TIME FOR SOLUTIONS OBTAINED USING
TWO TYPES OF MODELS (1) QUASI STEADY STATE
CONDITIONS AND (2) UNSTEADY STATE CONDITIONS
FOR A MIXTURE OF PROPYLENE (1900ppm) AND
PROPANE (950 ppm) EXHAUSTS ENTERING AT 390°C.
