CERTIFICATE

This is to certify that the thesis entitled "SOME GENERALIZED DISCRETE AND q -DISCRETE PROBABILITY DISTRIBUTIONS" which is being submitted by SUNGEETA SINGH for the award of DOCTOR OF PHILOSOPHY (MATHEMATICS) to the Indian Institute of Technology, Delhi, is a record of bonafide research work carried out by her under my guidance and supervision. The thesis has reached the standard fulfilling the requirements of the regulations relating to the degree. The results obtained in the thesis have not been submitted to any other University or Institute for the award of any degree or diploma.

B.R. HANDA

Professor
Department of Mathematics
Indian Institute of Technology
Hauz Khas, New Delhi-110016.
India.

ACKNOWLEDGEMENTS

Contributions of many people have led to the crystallization of my efforts in turning my distant dream into a vibrant reality.

Above all, I am immensely grateful to my thesis supervisor Professor B.R. Handa for his expert guidance combined with his support and patience throughout the preparation of this thesis. His painstaking efforts in critically examining and providing valuable suggestions deserve my sincere and heartfelt thanks. I shall be forever indebted to him for the knowledge gained during this period.

I take this opportunity to thank Professor S.R.K. Iyengar, Head, Department of Mathematics for his understanding and support in providing necessary facilities. A word of thanks is also due to Dr. A.Nagabhushanam for being ever so helpful in the lab. I gratefully acknowledge the friendly and encouraging support of the entire faculty and staff of the Department of Mathematics.

I would like to express my gratitude to the University Grants Commission (UGC), India in providing the financial support for carrying out this research work. I am thankful to the Librarian and library staff of Indian Statistical Institute, Delhi for being extremely kind and patient in extending library facilities.

My parents Shri O.P. Sehgal and Smt. Usha Sehgal deserve infinite words of appreciation and thanks not only for the inspiration, encouragement, love, support and blessings received from them but also for the precious qualities of patience and perseverance inherited from them which saw me through the most difficult times during the preparation of this thesis. I would also like to acknowledge the blessings and good wishes of my grandparents who inculcated in me a high regard for education right since childhood.

I am profoundly grateful to my husband Mr. Gyanendra Singh who was a pillar of moral support, co-operation, understanding and above all, immense patience during the most difficult phases of this thesis work. My daughter Gauri deserves not only a very special mention but my life long indebtedness for the exemplary courage and patience in staying away from me for pretty long hours in her most formative years.

My heartfelt thanks are due to Dr. Madhu Jain for her sincere advice, help and good wishes. A word of thanks are due to all my friends and colleagues Meera, Neela, Anamika, Ragini, R.K. Dash, V.Ravindranath, N.C. Mowlisaran, T. Selvakumaran and A.M.K. Tarabia who were always helpful and kept my spirits soaring in the most trying times.

Lastly, but by no means least, my sincere and heartfelt thanks to Ms. Neelam Dhody for her sincere and friendly co-operation combined with her efficient and kind assistance in the immaculate and flawless typing of the manuscript.

Sungeeta Singh

ABSTRACT
OF
THE THESIS
ENTITLED
SOME GENERALIZED DISCRETE AND q - DISCRETE
PROBABILITY DISTRIBUTIONS

Discrete models are used to represent processes where the output of interest is a count or enumeration. Continuous efforts have been made by researchers, through statistical and probability modelling, to study various discrete models and its properties which are of practical interest in various applied fields. The basic building block of many standard discrete distributions is the Bernoulli trial. In this thesis, discrete distributions based on Bernoulli trials with variable probabilities of success also known as Poisson trials are studied. Two special forms of these variable probabilities of success, one known as Log Linear Odds (LLO) probability and the other Log Linear (LL) probability, have been considered in order to make the models based on Poisson trials mathematically tractable. We call the trials with LLO or LL probability as q -Bernoulli trials so that when $q \rightarrow 1$, both of these reduce to Bernoulli trials. The corresponding distributions are called q -discrete distributions, which reduce to their ordinary counterparts as $q \rightarrow 1$. Besides studying several new properties of the known q -Binomial and q -Logarithmic series distributions, an attempt has been made in this thesis to define and study the q -Negative Binomial distribution, q -Hypergeometric distribution and

q-Negative Hypergeometric distribution in some details. Also a numerical method of moments estimation procedure has been developed for known and new q-distributions and illustrative data sets have been fitted. Also some new classes of q-discrete distributions have been defined and their properties which include moments, generating functions, some characterizations and limiting properties have been established.

Apart from the q-discrete distributions, two different generalizations of probability distributions based on first passage events and associated with Bernoulli trials with constant probability of success have been studied. The first one uses independent Bernoulli trials and gives rise to discrete distributions commonly studied under the title of distributions of order k. A Generalized Negative Binomial Distribution of order k, its Multiparameter and Multivariate Generalizations have been studied alongwith their moment and limiting properties.

The second generalization uses sequences of independent Bernoulli trials with the r.v. at the i^{th} trial taking value $-\mu_i$ or 1 with probability q or p respectively. The first passage probability to a given position on the random walk defined on this sequence of Bernoulli trials give rise to a class of multiparameter discrete distributions. The moment properties of particular cases of this class are discussed.

CONTENTS

	PAGE NO
CHAPTER 1: INTRODUCTION	1-57
1.1 Introduction	1
1.2 Notations and Definitions	10
1.3 Literature Review	15
1.4 General Organization of Chapters	54
CHAPTER 2: q-ANALOGUES OF DISCRETE DISTRIBUTIONS	58-126 (xiv)
2.1 Introduction	58
2.2 q-Binomial Distribution	59
2.3 q-Negative Binomial Distribution	64
2.4 q-Logarithmic Series Distribution	69
2.5 q-Hypergeometric Distribution	79
2.6 q-Negative Hypergeometric Distribution	89
2.7 Numerical Moment Estimation of Parameters of q-Discrete Distributions	99
2.8 Simulation Study to Judge Adequacy of Moment Estimation Procedure	125
CHAPTER 3: A q-GENERALIZED BIRTH AND DEATH PROCESS AND ASSOCIATED q DISCRETE DISTRIBUTIONS	127-184
3.1 Introduction	127
3.2 A q-Generalized Birth and Death Process	128
3.3 Properties of the q-Generalized Class of Discrete Distributions	135
3.4 q-Class of Distributions	149
3.5 Some Properties and Distributional Results for the q-Class of Distributions	162
3.6 Estimation Problem for a q-Class of Distributions	180

CHAPTER 4:	SOME GENERALIZED NEGATIVE BINOMIAL DISTRIBUTIONS OF ORDER k	185-232
4.1	Introduction	185
4.2	A Generalized Negative Binomial Distribution of Order k	187
4.3	A Multivariate Generalized Negative Binomial Distribution of Order k	201
4.4	A Multiparameter Generalized Negative Binomial Distribution of Order k	218
CHAPTER 5:	A CLASS OF DISCRETE DISTRIBUTIONS ON A RANDOM WALK	233-259
5.1	Introduction	233
5.2	A Multiparameter Class of Distributions	237
5.3	Random Walk Model and Probability Distributions	241
5.4	Factorial Moments of the Multiparameter Class	248
5.5	Concluding Remarks	257
