

A STUDY OF SOME ASPECTS OF SUSTAINABLE DEVELOPMENT OF INDIA'S WATERS

by

QUAMRUL HASSAN

Department of Civil Engineering

Submitted

in fulfilment of the requirements of the degree of Doctor of Philosophy

to the

Indian Institute of Technology, Delhi
July, 2004

Dedicated to

My father (late) and my role model
who couldn't see the day,

My youngest and the dearest sister,
whom Almighty has taken back from
us so early and suddenly, still difficult
for me to accept the fate,

My loving mother.

CERTIFICATE

This is to certify that the thesis titled, **“A Study of Some Aspects of Sustainable Development of India’s Waters”**, being submitted by **Mr Quamrul Hassan** to the Indian Institute of Technology, Delhi, India for the award of the degree of **DOCTOR OF PHILOSOPHY**, is a record of bonafide research work carried out by him under my supervision and guidance. The thesis work, in my opinion, has reached the standard, fulfilling the requirements for **DOCTOR OF PHILOSOPHY** degree. The research report and the result presented in this thesis have not been submitted, in part or in full to any other university or institute for the award of any degree or diploma.

(Prof. N. K. Garg)
Department of Civil Engineering
Indian Institute of Technology
New Delhi 110 016, INDIA

ACKNOWLEDGEMENTS

All praise belongs to Almighty Allah, the Creator and Sustainer of all creatures.

Words will never be able to express the human feelings especially for someone who commands a very special bond, high regard and has profound human touch. In my case, he is none other than Dr. N. K. Garg, Professor, Civil Engineering Department, I.I.T. Delhi and my Ph.D. supervisor. I express my deep sense of gratitude to him. He has always stood by me in the time of crisis - personal, professional and of course this research work. Without his support, the present study would not have been a reality. I will be in indebted to him forever.

I also express my sincere regards to Prof. M. C. Chaturvedi, former Emeritus Professor, I.I.T. Delhi who has been source of inspiration and guidance throughout this research work. Special thanks to Prof. Vipula Chaturvedi for her encouragement and moral support.

I am grateful to Prof. A. K. Nagpal, Prof. Sushil, Prof. Shahi Mathur and Dr. B. P. Parida, for their suggestions during the course of this study. Thanks are also due to all the Water Resources faculty members at I.I.T. Delhi for their encouragement and support.

I express my deepest regards and gratitude to Prof. Iqbal H. Khan, Professor Emeritus, in Jamia Millia Islamia, New Delhi, who has been my mentor since joining the academics and has groomed me since then in this profession. He has always motivated and encouraged me for excellence.

My sincere thanks are also due to my colleagues in Jamia for their support during this work specially to Prof. S. Sikander Nabi, Prof. Khalid Moin, Prof. M. N. Doja, Prof. Inayat Ali Zaidi, Dr. Mukhtar Ahmad, Dr. Masood Alam, Dr. Shamshad Ahamd and Dr. Z. Mallick for their cooperation during the period of this study.

My fellow scholars, friends and colleagues have helped me immensely during this study. In this regard I sincerely thank - Md Shoaib Anwer, S. M. Abbas, Naved Ahsan, S. K. Ambast, R. K. Gupta, Lalit Jaywardhene, M. J. Kaledhonkar, S. D. Dhiman, M. Kalita, S. Chakma, P. P. Lodha, Amardeep Singh, D. L. Parmar, B. K. Yadav, Bushra, Satpathy, Rehan A. Khan, Md Umair, M. P. Singh, Kamran Akhtar, A. N. Siddiqui and Manaullah. I will cherish their company.

I am extremely thankful to Sh. Rajveer Aggarwal, Sh. Bikram Chand, Sh. Arora, and Sh. Pooran Chand for their support during this work. I also express my thanks to Mr. Shamim A. Khan, Mr. S. M. Javed Hassan, and Mr. Yasir Jalal for their cooperation in Jamia that helped me in completing this work.

I owe a lot to my brother Md Z. Hassan, for whatever I am today. Nothing will suffice to express to my gratitude to my mother, for her love and affection, and the prayers she is making for the completion of this work.

(Quamrul Hassan)

ABSTRACT

Humanity is facing a worsening series of local and regional water quantity and quality problems, largely as a result of poor water allocation, wasteful use of the resources, sectoral approach towards water resources, and lack of adequate management actions. There is no one to one relationship between population and water requirement but it is evident that with improvement in standard of living the water demands per capita increases. In India the pressure on water resources is becoming alarmingly high in view of the large population and its continued growth along with economy. From the literature review, it is evident that no comprehensive policy regarding water resources development is available in India and the decisions are taken on adhoc basis. The sectoral approach of water resources development causes other associated problems and therefore it is not sustainable. The vision of a more sustainable water future, a policy framework tool, and practical steps towards sustainable development of water resources are needed. From the studies, it is evident that the complexity and interdependence are the salient features of water resources development. The study of sustainable development of the water resources requires an integrated approach towards water resources management and the understandings of long-term interactions among the human development, resource base of water and environment in a comprehensive way. Therefore, it is most desirable to explore the various policy options with the help of an interactive model in the search of a sustainable policy for water resources development. In the present study, an effort is made in this direction and a comprehensive framework model based on system dynamics concepts is developed and is named as INDIAWATER.

INDIAWATER can be understood as a set of interlinked sub-systems and has been schematized into four sub-systems: pressure, state, impact, and response. Accordingly INDIAWATER integrates the four interacting sub-models. The human development exerts pressure on the water system and as a consequence, the state of water system changes. These changes have impacts on water supply. These impacts in turn will evoke policy responses, in the form of actions that feedback upon the pressure, or directly upon the state or impacts. Indicators are used to represent the status and performance of various sub-systems that help in updating the policy.

The application of model requires an operating policy and data framework. The operating policy and data framework for simulation of INDIAWATER in the Indian context has been worked out. For such a large scale of study requires huge data which has been collected from various government organisations and international agencies and published reports. The collected data are presented comprehensively and uniformly. Sometimes required data are also derived from the developed database in the present study. The simulation period is from the year 1990 to 2050.

The model is validated before its application for different combination of population and economic development for evolving a sustainable policy for water resources development. The simulation results for the given data framework are presented and analysed. Five combinations of population and economic development are considered namely – Population and Economic Development – Low scenario, (PEDL); Population and Economic Development – Medium scenario (PEDM); Population and Economic Development - High scenario (PEDH); High projection of Population & Low projection of Economic Development, (PEDHL), and Low projection of Population & High projection of Economic Development (PEDLH). For each

combination of population and economic development, three cases are considered for the simulation depending upon the level of water supply system efficiency, pricing policies, technological improvement, recycling, and type of water resources development. The model is run for all these scenarios and results are presented and analysed. Water supply efficiency, pricing policy, recycling of wastewater, technological improvement, and type of water resources development are considered as key variables to explore a sustainable policy to meet a particular target for the desired population and economic development. In some cases, the contribution of foodgrains from irrigated areas, (fgirr) and lower fertilizer consumption are also considered to explore a sustainable policy, to reduce the pollution level, if required.

Based on the present study it is found that that water resources developments are sustainable under population and economic development – low scenario (PEDL) and medium scenario, PEDM. But it is considered unsustainable under PEDH because of high water demand and pollution level. Under PEDHL i.e. high population and low economic development scenario it may not be sustainable because of expenditures of high order of GNP. Under low population and high economic development (PEDLH), the water resources development are sustainable only if high level of water supply efficiency, high pricing policy, high technological improvement, recycling of industrial wastewaters, and low fertiliser consumption are considered.

Although it will also be necessary to back up the policy with appropriate institutional modernization as technology and social institutions are the two essentials for water resources management but the present study is limited to evolve a long-term sustainable policy for water resources development.

TABLE OF CONTENTS

	Page No.
Certificate	i
Acknowledgment	ii
Abstract	iv
Table of Contents	vii
List of Figures	xii
List of Tables	xix
List of Notations	xxii
 CHAPTER 1 INTRODUCTION	
1.1 General	1
1.2 Issues	2
1.3 Sustainable Development of Water	9
1.4 Objective of the Present Study	14
1.5 Scope	15
1.6 Overview	15
 CHAPTER 2 LITERATURE REVIEW	
2.1 Introduction	16
2.2 Sustainable Development	21
2.3 Sustainable Development of Water	24
2.4 Aspects of Water Resources Development	28
2.4.1 General	28
2.4.2 Pricing, efficiency, demand and sustainability of water systems	52
2.4.3 Reuse and recycling	63
2.4.4 Water demand projections	67

2.5	Studies Related to India	74
2.6	System Dynamics Studies	86

CHAPTER 3 WATER RESOURCES DEVELOPMENT OF INDIA - PRESENT APPROACH AND IMPLICATIONS

3.1	Introduction	97
3.2	Population and Urbanisation	102
3.3	Economic Growth and Transition	104
3.4	Foodgrains Production and Requirements	107
3.5	Physiography and Land	111
3.5.1	Physiography	112
3.5.2	Climate	113
3.5.3	Agroclimatic Zones	114
3.5.4	Land Use Classification	114
3.5.5	River Basins	117
3.6	Development of Irrigation in India	120
3.6.1	Development of irrigation since ancient times till the year 1800	120
3.6.2	Development of irrigation during pre-independence period	121
3.6.3	Development of irrigation after independence	123
3.6.4	Irrigation Growth - Scientific, Technological and Management Aspects	126
3.6.5	Pricing Aspects	127
3.7	Water Supply, Sanitation, and Wastewater Treatment	129
3.7.1	Water Supply and Sanitation Coverage and Approach	130
3.7.2	Outlay for Water Supply and Sanitation through the Plan	133

3.7.3	Wastewater Treatment Status	134
3.7.4	Management Issues	137
3.8	Water Resources of India	138
3.8.1	Assessment of Water Resources Potential	139
3.8.2	Utilisable Surface Water	144
3.8.3	Ground Water Resources	149
3.8.3.1	Dynamic Ground Water or Replenishable Ground Water	150
3.8.3.2	Static Ground Water	151
3.8.4	Fresh Water Resources at a Glance	154
3.9	Water Quality and Environment	154
3.10	Water Demand Estimation and Projections	161

CHAPTER 4 PROBLEM FORMULATION AND MODEL DESCRIPTION

4.1	Introduction	167
4.2	System Dynamics	169
4.3	Conceptualisation of 'INDIAWATER'	174
4.4	Formulation of the INDIAWATER	177
4.4.1	Pressure sub-model	178
4.4.1.1	Water demand	181
4.4.1.2	Consumptive water use and wastewater generation	193
4.4.2	State sub-model	196
4.4.2.1	Water resources	198
4.4.2.2	Water quality	201
4.4.3	Impact sub-model	206

4.4.4	Response sub-model	213
4.5	Indicators	219
4.6	Modules to INDIAWATER	223
4.6.1	Population Module	223
4.6.2	Economy Module	223
4.6.3	Land Module	224
4.7	Simulation of INDIAWATER	229

CHAPTER 5 OPERATING POLICY AND DATA FRAMEWORK FOR THE MODEL IN INDIAN CONTEXT

5.1	Introduction	231
5.2	Input Parameters for Modules to INDIAWATER	232
5.3	Input Parameters for Internal Variables	241

CHAPTER 6 MODEL APPLICATION - SCENARIO AND ANALYSIS

6.1	Introduction	276
6.2	Validation of the Model	278
6.3	Population and Economic Development - Low Scenario (PEDL)	282
6.4	Population and Economic Development - Medium Scenario (PEDM)	303
6.5	Population and Economic Development - High Scenario (PEDH)	325
6.6	High Population and Low Economic Development Scenario (PEDHL)	345
6.7	Low Population and High Economic Development Scenario (PEDLH)	351

CHAPTER 7 SUMMARY AND CONCLUSIONS

7.1	Policy and Water Resources Development	361
7.2	Water Resources Development in India	363
7.3	Methodology	365

7.4	Development of Model	366
7.5	Operating Policy and Data Framework for the Proposed Model	368
7.6	Model Application and Summary of Results	368
7.6	Contributions of the Present Study	378
7.7	Recommendations for Future Studies	379
