

TALL BUILDINGS WITH STAGGERED SHEAR WALLS

by

K.N.V. PRASADA RAO

Thesis Submitted to the
Indian Institute of Technology, Delhi
for the award of the degree of
DOCTOR OF PHILOSOPHY

Department of Civil Engineering
Indian Institute of Technology, Delhi

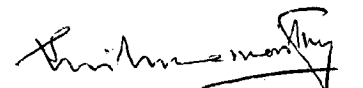

March, 1978

CERTIFICATE

This is to certify that the thesis entitled "TALL BUILDINGS WITH STAGGERED SHEAR WALLS"; being submitted by Mr. K.N.V. Prasada Rao to the Indian Institute of Technology, Delhi, for the award of the degree of DOCTOR OF PHILOSOPHY in Civil Engineering, is a bonafide research work carried out by him.

To the best of our knowledge the thesis has reached the requisite standard. The material presented in this thesis has not been submitted in part or in full to any other University or Institute for the award of any degree or diploma.

(K. Seetharamulu)

(S. Krishnamoorthy)

ACKNOWLEDGEMENT

I express my deep gratitude to Professor K. Seetharamulu for the invaluable guidance and kind encouragement throughout the investigation. But for his keen interest this work would not have been possible. I am highly indebted to Professor S. Krishnamoorthy for his keen interest in my progress and valuable guidance especially in the experimental investigation and for his helpful suggestions.

I am obliged to the Department of Technical Education, Government of Andhra Pradesh for deputing me to undertake this study. I also acknowledge with gratitude the financial assistance received from the Government of India, under the Quality Improvement Programme.

I am grateful to the staff of the Concrete Structures Laboratory and Workshop of the Department for their help during the experimentation. My special thanks are due to Shri Badleram who fabricated the perspex models.

I am thankful to Professor M. Raghupati, Dr. T.K. Datta and Dr.A.K. Nagpal for their help and useful discussions. I thank all my colleagues and friends who have been helpful all the time.

K. N. V. Prasada Rao

K.N.V. Prasada Rao

ABSTRACT

Tall buildings are usually provided with shear walls extending from foundation to roof to resist lateral loads. For architectural, structural or functional reasons it may be necessary, sometimes, to omit the wall in ground floor or discontinue it in some intermediate storeys. The concept of providing storey-deep and bay-wide discrete panels to resist lateral loads is now introduced. Three different systematic arrangements of panels are investigated. Both static and dynamic responses are evaluated for the proposed staggered shear panel system and are compared with those of the conventional shear wall system.

Three methods of analysis are presented based on the idealisation of a discrete panel as (i) rigid panel (ii) wide column with rigid or finite arms and (iii) assembly of finite elements. The first two methods do not correctly predict the behaviour of the system. A finite element method using Macleod's pair of elements, which consider inplane rotation is found to be adequate. Mesh divisions of 4x4 elements in each panel lead to fairly accurate overall solution. For precast large panel construction a simpler method of analysis (Stringer Method) amenable for hand computations is suggested.

In the proposed system the skeletal members attract more end forces. But it is superior to the conventional system in respect of sway at top and panel base moments and shears. By suitable disposition and dimensioning of discrete panels the

lateral deflections due to horizontal loading can be controlled which gives flexibility to the designer. Distress at the corners of a panel where concentration of stresses occurs can be avoided by extending column and girder reinforcements into the panel.

The dynamic response of the proposed system is comparable with that of the conventional one. In respect of top displacements the proposed system is superior for buildings of moderate height.

Four perspex models and three reinforced concrete panels were tested for assessing the overall behaviour (static and dynamic) and to investigate the effect of stress concentrations at panel corners, respectively.

CHAPTER I

Introduction and Literature Review

1.0	Detailed Contents of Chapter I	1
1.1	Introduction	2
1.2	Literature Review	4
1.3	Scope of the Present Investigation	30
1.4	Analytical Investigation - Static Analysis	31
1.5	Analytical Investigation - Dynamic Analysis	32
1.6	Experimental Investigation	32
1.7	General Remarks	34

CHAPTER II

Analytical Investigation - Static Response of Staggered Panel System

2.0	Detailed Contents of Chapter II	35
	Part A: Static Analysis of Staggered Panel System	
2.1	General Introduction	37
2.2	Proposed Methods of Analysis	37
2.3	Finite Element Method	54
2.4	Comparison between Different Methods of Analysis for the Staggered Panel System	74
2.5	Large Precast Panel Construction	82
2.6	Static Stability Considerations for Staggered Panel System	87
	Part B: Behaviour of Staggered Panel System Under Static Load	
2.7	General	90

2.8	Horizontal Deformations	92
2.9	Bottom Shear Panel-Effect of its omission	99
2.10	Base Moments and Shears	103
2.11	Axial Forces in Panels and Columns	113
2.12	Axial Forces in Girders	118
2.13	Concentration of Stresses in Panels	123
2.14	Concluding Remarks	124

CHAPTER III

Analytical Investigation - Dynamic Response of Staggered Panel System

3.0	Detailed Contents of Chapter III	128
	Part A: Dynamic Analysis of Staggered Panel System	
3.1	General Introduction	129
3.2	Essential Features of a Dynamic Problem	129
3.3	Dynamic Characteristics	130
3.4	Response to Dynamic Loading	134
3.5	Damping Matrix	136
3.6	Flow Chart	139
3.7	Dynamic Response to Koyna Earthquake	141
	Part B: Behaviour of Staggered Panel System Under Dynamic Load	
3.8	General	146
3.9	Comparison of Methods of Analysis	146

3.10	Response Comparison	149
3.11	Miscellaneous	157
3.12	Concluding Remarks	159
