STUDY OF FLUID QUEUES AND ITS APPLICATIONS

by

Shruti Kapoor

Department of Mathematics

Submitted

in fulfillment of the requirements of the degree of Doctor of Philosophy

to the

Indian Institute of Technology Delhi
OCTOBER 2016

Dedicated to My Family

Certificate

This is to certify that the thesis entitled "*Study of Fluid Queues and its Applications*" submitted by *Ms. Shruti Kapoor* to the **Indian Institute of Technology Delhi**, for the award of the Degree of **Doctor of Philosophy**, is a record of the original bona fide research work carried out by her under my supervision and guidance. The thesis has reached the standards fulfilling the requirements of the regulations relating to the degree.

The results contained in this thesis have not been submitted in part or full to any other university or institute for the award of any degree or diploma.

Indian Institute of Technology Delhi

Acknowledgements

I am taking this opportunity to thank individually, all those who have been associated in one way or the other, throughout my Ph.D work. First of all, I thank the Almighty God for his blessings on me which made me to reach this place and always providing me the best of everything.

I express my sincere gratitude to my Ph.D supervisor Dr. S. Dharmaraja for his invaluable guidance and continuous encouragement. He has always been extremely generous with his time, knowledge and ideas and allowed me great freedom in this research. I would not have been able to accomplish this work without his constant encouragement, inspiring criticism and motivation.

I am very much thankful to Prof. B. Sericola, INRIA, IRISA, France, Prof. R.B Lenin, University of Central Arkansas, Conway, United States and Prof. Viswanathan Arunachalam, National University of Colombia, Bogota, Colombia whose comments and suggestions were useful in this research. I thank IIT Delhi authorities for providing the essential facilities for pursuing the research.

Special thanks to my SRC members, Dr. Swadeh De, Dr. Aparna Mehra and Dr. Niladri Chatterjee for spending their invaluable time during the discussions over seminars.

It is a pleasure to acknowledge my junior colleagues: Arti and Anupam for their co-operation, companionship and technical interactions.

I am greatly indebted to my parents Shri. R.C Kapoor and Smt. Anita Kapoor, my sisters Hema Handa and Monika Seth, my father-in-law Shri. R.P Tohan and mother-in-law Smt. Geeta Tohan, my brother-in-law Animesh Tohan and sister-in-law Suriti Tohan and my extended family for their understanding, support, encouragement and motivation during the entire research period. And last but not the least, heartfelt thanks to my husband Abhishek Tohan and our daughter Paavni Tohan for their cooperation and support.

Abstract

Fluid queues are a specific category of queues where the inflow/outflow of customers or the amount of work in the system changes at a rate dependent on some stochastic process. As in queues, in these models some continuous entity, referred to as fluid, are the individual customers. Flow of the fluid into the reservoir is governed by some stochastic process. The fluid flow, out of the reservoir is controlled by another stochastic process, which can be considered similar to a server, allowing fluid to flow out. The buffer content cannot be negative, so when the buffer content decreases to zero, the buffer content stays zero as long as the constant rate is negative.

The purpose of this thesis is to determine the probability distribution of the buffer content at any given time t for this type of queues. Different methodologies are used to find the solution for various fluid models.

The thesis is divided into six chapters. Chapter 1 is introductory in nature giving a brief description of fluid queues and its applications. A short account of mathematical modeling paradigms used in the thesis like stochastic processes, queues, Markov modulated fluid queues, solution of a fluid queue model and methodologies used to find it are also presented. Chapters 2 and 3 deal with the fluid queues driven by a birth death process with rational birth and death rates. In Chapter 2, the transient solution is obtained in closed form using the continued fraction approach. We also discuss the concept of an absorbing state and its effect on the solution. However, in Chapter 3, the steady state solution was obtained for the model considered by finding eigen values of the underlying tridiagonal matrix. Two specific models are considered and closed form solutions are obtained for the equilibrium distribution of the buffer occupancy. The solutions obtained in both chapters is verified through numerical illustrations.

Chapter 4 presents the transient behavior of an $M/M/1$ driven fluid queue using simple probability concepts. The transient solution is obtained with the help of recursive functions where the recurrence relations are explained using probability concepts. Further, the transient

solution of the fluid queue driven by an $M/M/1/N$ queue is also obtained. Finally, numerical results are presented for the illustration of the proposed approach.

Chapters 5 and 6 are based on applications of fluid queues.

In Chapter 5, a fluid queue approach to model the quantity or amount of information stored in intermediate nodes and the flow of information in a network based on the IEEE 802.11 protocol is presented. Using the fluid queue model, the transient distribution of the buffer content at any intermediate node is obtained. Certain performance measures relevant to a communication network such as server utilization, average throughput, mean delay and expected buffer content are also obtained at the fluid queue level.

In Chapter 6, a fluid queue is used to find the transient distribution of the amount of charge in a rechargeable battery of finite capacity. The level of charge in the battery is governed by different input and output processes and are dependent on the level of charge in the battery. The considered model has been discussed in [19], and the distribution of the hitting time was found numerically. In this chapter the solution method is based on probabilistic approach and a closed form solution is obtained for the distribution of the level of charge in the battery at any time t . Numerical illustrations are carried out in the end to verify our results.
