## CERTIFICATE

This is to certify that the thesis entitled “**Biomethane from algal biomass: Feasibility enhancement through pretreatment, codigestion and coupling with wastewater treatment**” being submitted by **Mr. Sanjeev Kumar** to the Indian Institute of Technology Delhi for the award of the degree of ‘Doctor of Philosophy’ is a record of bonafide research work carried out by him. He has worked under our guidance and supervision and has fulfilled the requirements for the submission of this thesis. To the best of our knowledge the results contained in this thesis have not been submitted in part or full to any other University or Institute for the award of any degree or diploma.

Dr. Anushree Malik

Associate Professor

Dr. Virendra Kumar Vijay

Professor

Centre for Rural Development and Technology

Indian Institute of Technology, Delhi

## ACKNOWLEDGEMENTS

It has been a great privilege to spend four years at the Centre for Rural Development and Technology (CRDT), Indian Institute of Technology, Delhi. The list of the people I need to thank will not fit to a single Acknowledgement section. I just mention some people whose contribution is obvious.

First and above all, I cannot begin this acknowledgement without thanking the Almighty *GOD* for his unparalleled grace and superior protection. Foremost, I pay homage to my supervisors Dr. Anushree Malik and Prof. Virendra Kumar Vijay for providing me with the opportunity to complete my PhD thesis. This work would not have been possible without their guidance, support and encouragement. Their critical assessment and affectionate words kept me motivated to perform best.

I would like to thank my SRC members, Prof. S. N. Naik, Prof. T. R. Sreekrishanan and Prof. Satyawati Sharma for providing valuable suggestions and expert advice throughout the course of this study. The moral support, useful suggestions and guidance rendered by Prof. H. K. Malik, Physics Department, is highly acknowledged. I also would like to thank all the faculty members of CRDT for extending all the possible help in completing my thesis on time. I am grateful to Mr. Amit Kumar (Biogas Laboratory) for helping me in GC analysis. I also acknowledge the kind support of Prof. M G Dastidar, Centre for Energy Studies in CHNS analysis.

I am also extremely indebted to Prof. Satyawati Sharma, Head, CRDT for providing necessary infrastructure and resources to accomplish my research work. Facilities at Applied Microbiology and Biogas Research Laboratory benefited my research work extensively. SEM facilities availed from Department of Textile are gratefully acknowledged.

The utmost cooperation of office and lab staff especially, Mr. Sabal Singh, Mr. Vinod Kumar and Mr. Vikram Singh is sincerely acknowledged. I express my earnest thank to Dr. Prachi Kaushik, Dr. Amit Kumar Tyagi and Dr. Abhishek Mishra for their kind support and invaluable suggestion during my thesis. I highly appreciate efforts made by Mr. Arghya Bhattacharya for teaching me MATLAB and EndNote as well as in proof reading of the thesis. My sincere thanks to Mr. Pushpendar Kumar and Ms. Poonam Choudhary for providing great support in experimental work. I am also thankful to Mr. Sanjay Kumar Guda, Mr. Nitin Chauhan and Mr.

Manish Kandpal for encouraging me at every step of my thesis. I express my sincere thanks to Mr. Pushap, Mr. Deepak, Mr. Sharad, Ms. Priyadarshini Dey Dr. Meena, Ms. Rimika and other labmates for the love, care and pleasant company throughout.

A heartfelt “thanks” to my wife, Manisha Prajapati who already had my heart, for all her concern, understanding, love and encouragement allowed me to finish this journey. I owe a lot to my parents, siblings and in-laws, especially my father Mr. Sumer Singh Prajapati and mother-in-law Mrs. Kamala Srivastava, who encouraged and helped me at every stage of my personal and academic life and longed to see this achievement come true.

## ABSTRACT

The present study was targeted towards enhancing the feasibility of algal biomethanation through various innovative interventions. To begin with, multifarious screening of procured as well native algal culture was done with respect to biomass productivity, biochemical composition as well as the stoichiometric methane potential (SMP). Biomass composition of tested algae depicted their suitability for biomethanation. Indeed, the SMP of all the tested algae was relatively higher than the non-algal biomass reported in literature. The biochemical methane potential (BMP) and digestibility estimation lead to selection of native alga *Chroococcus* sp.1 for biomethane production. *Chroococcus* sp.1, having good biomass potential (biomass concentration  $\approx 1.35 \text{ g L}^{-1}$  in 12 d growth assay) and balanced biochemical composition, showed maximum BMP (up to  $254 \text{ mL CH}_4 \text{ g}^{-1} \text{ VS}_{\text{fed}}$ ), among the tested algae. On the other hand, *Spirulina* sp., which was highest biomass producer (biomass concentration  $\approx 1.35 \text{ g L}^{-1}$ ) had poorest BMP ( $89 \text{ mL CH}_4 \text{ g}^{-1} \text{ VS}_{\text{fed}}$ ) due to improper biochemical composition. From the present findings, it was experimentally confirmed that along with biomass productivity, biomass composition is also a crucial parameter in the selection of algal strain for biomethane production.

During the detailed anaerobic digestion of *Chroococcus* sp.1 poor digestibility was evident from presence of intact algal cells in the digestate after 45 d of anaerobic digestion. The pioneering attempts focusing pretreatment of algal biomass with fungal crude enzymes (produced by *A. lentulus* under solid state fermentation using sugarcane bagasse as substrate) and its subsequent codigestion with cattle dung depicted great potential for improving algal digestibility and BMP. In fact, up to 50 % COD solubilisation from algal biomass was observed during its pretreatment with crude enzyme under optimal conditions (pH = 5.0 and temperature =  $60^\circ \text{C}$ ) within 2.5 h. The corresponding enhancement recorded in the BMP was 27 %, which eventually increased to 62.54 %, when it was codigested (in 1:1 ratio on VS basis) with cattle

dung. In contrast, the codigestion of fresh algae with cattle dung showed only 14 % enhancement in BMP. Hence, fungal crude enzymes as pretreatment agent and cattle dung as cosubstrate have immense potential to improve the feasibility of algal biomethane process. Besides this, a novel bioagent was also identified which was efficient for simultaneous harvesting (nearly 100 % in 6 h) and pretreatment of selected algae which eventually resulted in >50 % enhancement in BMP. Overall, the bioagent based harvesting and pretreatment had potential to decrease the algal digestion time to 15 d (instead of 30 d needed for fresh algal biomass) with BMP up to 370 mL CH<sub>4</sub> g<sup>-1</sup> VS<sub>fed</sub>.

With the view to reduce nutrient input cost, rural sector grey water (RSW) and algal digestate were used for algae cultivation. RSW supplemented with 30 % of algal digestate was found optimal for algal growth with simultaneous nutrients/COD reduction below safe discharge limits. Hence, a “closed loop process” for bioenergy generation employing anaerobic digestion of algal biomass and simultaneous nutrient recycling for wastewater and algal digestate was proposed. Feasibility analysis for a typical village (population ≈ 4000 adults) showed that the proposed process had renewable power generation potential up to 5413 kWh d<sup>-1</sup>. It also had capacity to treat > 0.5 MLD of RSW (with 0.199 MLD of algal digestate). The calculations validated the feasibility enhancement hypothesis of algal biomethane through coupling with wastewater treatment and liquid digestate recycling.
