

STUDIES IN THE STATISTICAL PROPERTIES OF  
PHOTOELECTRON COUNTING

by

Sushma Gupta

Thesis submitted to the Indian Institute of Technology, Delhi  
for the award of the Degree of  
DOCTOR OF PHILOSOPHY

Department of Physics  
Indian Institute of Technology, Delhi

February, 1975

## ACKNOWLEDGEMENTS

First and foremost I am grateful to Professor C.L. Mehta for suggesting the problem, his profound guidance and constant encouragement during the entire period of research work. This acknowledgement is not a part of the usual convention one carries out but I deeply and sincerely feel the necessity of it.

I am thankful to my colleagues Dilip Ranganathan, Mukesh K. Sharma, G. Bose, C.S. Vikram and Govind P. Agrawal for their cooperation and also to Alka, Maithily, Venkatraman and Sunil for their ready help.

Thanks are also due to Mr. T.N. Gupta for the efficient typing of the manuscript and to Mr. N.S. Gupta for the diagrams.

Research was financially supported by N.C.E.R.T.

## CONTENTS

CHAPTER		Page
I	INTRODUCTION	1-22
	1.1 Historical Remarks	1
	1.2 Counting Formula	4
	1.3 Some Consequences	10
	1.4 Intensity Fluctuations	12
	1.5 Integral Equation	17
II	POLARIZED MULTI-PEAK SPECTRAL PROFILES	23-75
	2.1 Introduction	23
	2.2 Solution of the Integral Equation	26
	2.3 Single Peak Lorentzian Spectral Profile	31
	2.4 Two Identical Lorentzian Peaks with Different Central Frequencies	37
	2.4.1 Limiting cases	52
	2.4.2 Mean and variance	55
	2.4.3 Comparison with Rice's Approximate result.	57
	2.5 Two Lorentzian Peaks with same Central Frequency but Different Widths and Intensities.	65
III	PARTIALLY POLARIZED MULTI-PEAK SPECTRAL PROFILES	76-92
	3.1 Introduction	76
	3.2 Partially Polarized Radiations	77
	3.3 Orthogonally Polarized Two Peak Spectral Profile	87
	3.4 Three Peak Spectral Profile	90
IV	INTER-ARRIVAL TIME DISTRIBUTIONS	93-117
	4.1 Introduction	93
	4.2 Arrival and Inter-Arrival Time Distribution	94
	4.2.1 Arrival time of the first photocount	95
	4.2.2 Inter-arrival time between two successive photocounts	97
	4.2.3 Distributions of the arrival times of the $n$ th count	102
	4.3 Joint Probability Distribution	108
	4.4 Correlations	113

V	DETECTORS WITH FINITE DEAD TIME	118-130
	5.1 Introduction	118
	5.2 Counting Formula in Presence of Dead Time	120
	5.3 Inversion Problem	122
	5.4 Illustration and Application	126
	5.4.1 Polarized thermal light	126
	5.4.2 Other examples	128
	APPENDIX-A : APPROXIMATE FORMULA FOR PHOTON COUNTING	131-138
	REFERENCES	139-144
