

PHYSICAL MODIFICATION OF NYLONS BY STRESS-AGING AND BLENDING

by
ANU VERMA

A thesis submitted to the
Indian Institute of Technology, Delhi
for the award of the degree of
DOCTOR OF PHILOSOPHY

Department of Textile Technology
INDIAN INSTITUTE OF TECHNOLOGY, DELHI
FEBRUARY 1984

To my mother
Mrs.Sneh Sakhuja

CERTIFICATE

This is to certify that the thesis entitled "PHYSICAL MODIFICATION OF NYLONS BY STRESS-AGING AND BLENDING", submitted by Mrs. Anu Verma, to the Indian Institute of Technology, Delhi for the award of Doctor of Philosophy, is a record of the bonafide research carried out by her. Mrs. Anu Verma has worked under our guidance for submission of this thesis, which to our knowledge has reached the required standard.

The thesis, or any part, thereof, has not been submitted to any other University or Institution for the award of any Degree or Diploma.

Prof. A.K. Sengupta

ACKNOWLEDGEMENT

I am at a loss for words to adequately thank my guide Doctor U.L.Deopura, for his most active participation and professional guidance throughout the course of this work. Thanks to his critical appraisal, wise suggestions and complete freedom of work, the entire study was most rewarding. I have truly gained after having worked under his able supervision.

I am also extremely grateful to my co-guide and teacher, Professor A.K.Sengupta for having associated himself with this project and for sharing with us his vast experience and in-depth knowledge of the subject.

I am thankful to the previous head of department, Prof.C.D.Shah, and the present head, Prof.P.Dajaj, for allowing me to use the facilities of the Textile department and for their interest in my progress.

I would also like to thank all the faculty and staff of the department for their willing co-operation, particularly Dr.V.K.Dhar, Mr.A.C.Vashisht, Mr.S.K.Sharma, Mr,Shalikram and Prakashji; Sharmaji of IDDC, Dr.Sehgal of the Department of Applied Mechanics, IIT, and Dr.A.Jain of ITMMEC, IIT. For their co-operation and goodwill, I am grateful to all my colleagues and fellow-students, especially to Manjeet Kaur Dhatia for listening to my woes. I would also like to thank my dear friend Mrs.Heather Dhatty.

A very special thanks goes to my parents-in-law, Col. and Mrs.B.L.Verma for instilling in me a respect for learning and

for their keen interest in my work and constant encouragement and moral support at all times. A most active interest and solid help from my husband, Nitin made the study more worthwhile.

My sincere gratitude goes to Miss.R.Fidelia Viola for painstakingly and cheerfully helping me in the preparation of this manuscript. I truly appreciate the time and patience she has ungrudgingly devoted to this.

Thanks are also due to Mr.Padam and Mr.Saini for their careful execution of the diagrams, to Mr.D.C.Sharma for the photography and to Mr.Nebul Prasad.

Most of all I thank Surabhi.

Pema

ADSTRACT

A study was conducted on physical modification of the structure of nylons by the method of stress aging and blending. Stress aging was carried out for drawn nylon-6 under a stress of 2g/d. Drawing at 50% r.h. followed by stress aging at 30% r.h. produced marked improvement in the tensile properties. This was attributed to the formation of stable microcrystals at 30% r.h. because of the unique, non-linear T_g vs regain relationship. On the basis of experimental observations it was possible to explain the reported non-linear trend in properties of nylons with increasing regain. Blending of nylon-6 and nylon-66 was carried out by co-extrusion in the whole range of compositions with particular emphasis on small amounts of one polymer in the other. Most significant improvement in properties were achieved at these low blend compositions in which the minor component remained amorphous while severely affecting the crystallization behaviour of the major component. The nylon-6 rich blends crystallized predominantly in the γ -crystalline form while the nylon-66 rich blends exhibited low crystallinity. Due to this the blends were more easily drawable, giving rise to a more highly aligned structure with improved tensile properties and better uniformity. Particularly high tenacity and modulus were observed for blend sample containing 70% nylon-6 and 30% nylon-66.

Abstract

CHAPTER 1	INTRODUCTION	
1.1	History	1
1.2	Existing methods of improving properties	1
1.3	Scope of this work	4
CHAPTER 2	REVIEW OF LITERATURE	
2.1	AGING EFFECTS	
2.1.1	General	7
2.1.2	Crystallization and morphology	9
2.1.3	Polymorphic forms of nylon	
	(A) Nylon 6	12
	(B) Nylon 66	21
2.1.4	Drawing behaviour of nylon	24
2.1.5	Glass transition temperature	30
2.1.6	Theories of moisture sorption	31
2.1.7	Effect of moisture on nylon	33
2.1.8	Physical aging of polymers	39

2.1.9	Effect of moisture on stress aging of nylon	41
2.2	POLYMER BLENDS	
2.2.1	General	45
2.2.2	Compatibility of polymers	46
2.2.3	Methods of blending used	51
2.2.4	Classification of polymer blends	53
2.2.5	Nature of components of the blend	54
2.2.6	Crystallization and Fusion behaviour of blends	61
2.2.7	Nylon-6 Nylon-66 Blends - State of the art	64

CHAPTER 3	EXPERIMENTAL DETAILS	
3.1	Characterization of materials used	69
3.2	Preparation of melt spun filaments	72
3.3	Drawing	75
3.4	Storing of filaments	76
3.5	Application of stress	76
3.6	Creating of appropriate aging humidity	76

3.7	Preparation of solvent blond films	79
3.8	Birefringence measurements	79
3.9	Density measurements	81
3.10	X-ray Diffraction	82
3.11	Differential Scanning Calorimetry	87
3.12	Thermogravimetric Analysis	89
3.13	Measurement of fibre fineness	90
3.14	Tensile measurements	90
3.15	Sonic Modulus Measurements	92
3.16	Dynamic Mechanical Measurements	93
3.17	Rheometry	94
3.18	Scanning Electron Microscopy	98

CHAPTER 4 RESULTS AND DISCUSSION : STRESS AGING

4.1	Effect of humidity during drawing	99
4.2	Aging	104
4.2.1	Effect of humidity during aging	104
4.2.2	Structure development during aging at 30% r.h.	108
4.3	Effect of moisture on physical properties of nylon	116

CHAPTER 5 RESULTS AND DISCUSSION : POLYMER BLENDS

5.1	Blending methods used	120
5.2	Thermal effects	121
5.2.1	Melting and Crystallization	122
5.2.2	Thermal degradation	127
5.2.3	Effect of holding the blend at high temperature	130
5.3	Crystallinity and Density	132
5.4	Dynamic relaxation behaviour	139
5.5	Orientation and Drawability	140
5.6	Tensile properties	147
5.7	Uniformity of blend filaments	153
5.8	Rheology	155
5.9	Scanning Electron Microscopy	160

CHAPTER 6 CONCLUSION AND SCOPE FOR FUTURE WORK

6.1	Conclusion	161
6.2	Scope for future work	165
