**VARIATIONAL INEQUALITY AND ITS VARIANTS
WITH
APPLICATIONS TO EQUILIBRIUM PROBLEMS**

by

RACHANA GUPTA

Department of Mathematics

*Submitted
in fulfillment of the requirements of the degree of
Doctor of Philosophy*

to the

Indian Institute of Technology Delhi

FEBRUARY 2015

Certificate

This is to certify that the thesis entitled “**Variational Inequality and Its Variants with Applications to Equilibrium Problems**” submitted by “**Ms. Rachana Gupta**” to the Indian Institute of Technology Delhi, for the award of the Degree of **Doctor of Philosophy**, is a record of the original bona fide research work carried out by her under my supervision and guidance. The thesis has reached the standards fulfilling the requirements of the regulations relating to the degree.

The results contained in this thesis have not been submitted in part or full to any other university or institute for the award of any degree or diploma.

Dr. Aparna Mehra
Associate Professor
Department of Mathematics
Indian Institute of Technology Delhi

Acknowledgements

First and foremost, I owe this thesis to my father Late Shri Shiv Nandan Gupta without whose concern and encouragement it would not have been possible for me to reach this place. His life-long support, unconditional love motivated me towards the successful completion of this study.

Reaching major milestones in one's life does not happen without the assistance of great many people, and for each one of them I am truly blessed and grateful.

It gives me immense pleasure to express my deepest gratitude to my supervisor Dr. Aparna Mehra, for her expert supervision and research insight, inspiration and above all her support for carrying out this work.

I would like to express my sincere gratitude to Prof. Didier Aussel (PROMES Laboratory, University of Perpignan, France) for his expert guidance and constant encouragement. This work would not have been completed without his support and enthusiasm. He treated me like his own student through his valuable suggestions, enthusiasm, vivid discussions and I am privileged to have the opportunity to work with him.

I would like to express my deepest regards and gratitude to Prof. Frederic Meunier (Centre d'Enseignement et de Recherche en Mathématiques et Calcul Scientifique (CERMICS), Ecole Nationale des Ponts et Chaussées, Paris) for building my understanding on Smart Grids - a new domain for me.

I would like to express my deepest thanks and gratitude to Prof. R. K. Sharma and Prof. Suresh Chandra for their unending encouragement, support and valuable feedbacks. I also learned a lot on optimization during my teaching assistantship with Prof Suresh Chandra.

I express my regards to Prof. S. Dharmaraja (Head of the Department), Prof. B.S. Panda and Prof. Anshul Kumar (former Head of the Department) for their support. I would like to give special thanks to my SRC (Student Research Committee) Member: Prof. Naveen Garg (Department of Computer Science) and external members : Prof. Arunava Sen, ISI Delhi and Prof. S. K. Neogy, ISI Delhi, for

their valuable suggestions on my research work.

I am thankful to IIT Delhi authorities for providing me the necessary facilities and teaching assistantship for smooth completion of my research work. I express my gratitude to all the faculty members and staff of the Department of Mathematics, IIT Delhi, for their encouragement.

I am thankful to the authorities of PROMES Laboratory, France, and University of Perpignan, France, CERMICS and Ecole Nationale des Ponts et Chaussées, Paris, for providing me opportunity to work there during my PhD. Thanks are due to the Science and Technology Department, French Embassy, India, for awarding me "Sandwich Fellowship" to do research in PROMES laboratory, University of Perpignan, France, and Paris Institute of Technology (ParisTech) for selecting me for "IIT-ParisTech mobility programme" and providing me "ParisTech Scholarship" to do research in CERMICS. I would like to thank Egide, France to provide me the financial support to participate in all the conferences and for accommodation during my long visit to PROMES laboratory, France. I express my special thanks to Farid Saadoun from Egide and Vivek Dham from Science and Technology Department, French Embassy, India, and Sebastien Fernandez from ParisTech, who always made sure that all my fellowship related administrative work got done in time. I would like to thank the Council for Scientific and Industrial Research (CSIR) for providing me financial assistance by awarding me research fellowship throughout my PhD.

I would also like to thank the reviewers of our papers, editors of journals, and the academicians whom I have met over the past years at various conferences and workshops for their valuable comments.

It appears almost impossible to thank each one of my friends here individually, but I would like them to know that the happy memories of my friendship with them always remain in the deepest corner of my heart. Thank you David B. Tsuanyo, Michal Cervinka, Miroslav Pistek, Fabien Delaleux, Isabelle for affection and support during my visit to PROMES, France. I really enjoyed a lot with them. Thank you my friend Matthieu Marechal for his generosity, unending encouragement, and his everlasting affection. Thanks to Daniel Chemla and Pauline Sarrazebolles for their goodness and support during my visit to CERMICS, Paris. And a special thanks to my friend and research collaborator Thomas Pradeau for long discussions and patience.

No words are enough to thank friends Sheetal, Rabia, Sarvesh, Arti Pandey, Varsha, Ankita Jindal, Sudhakar, Amit Sharma, Alok and Bhavya for their generosity, unending encouragement and help. They gave me strength as well as happiness and laughter. My beloved friends Himanshu Gupta and Ankita Nigam will always have special place in my life for so much selfless love and faith in me.

Thanks to all my friends on Facebook for the list is endless to name all here.

Words cannot completely express my love and gratitude to my family who have supported and encouraged me through this journey. I would like to thank my mother Rama Gupta for her life-long support, and sacrifices, which sustained my interest in research and motivated me towards the successful completion of this study. My heartiest thanks to each of my family member who have supported me through my difficult times with their inspiration and continued encouragement.

Finally, I thank the almighty God for the passion, strength, perseverance, and the resources to complete this study.

Rachana Gupta

Abstract

Modeling, analysis and computation of different equilibria using mathematical programming techniques is cited as the “Equilibrium programming”. There are numerous efficient methods that had been developed to analyze and numerically solve models of economic and game theoretic equilibrium in recent years. The initial methods which were used to compute economic equilibria, were fixed point methods which were proved to be theoretically very powerful. Another approach for solving equilibrium models is via nonlinear optimization. Since this approach requires very restrictive assumptions on the models in order to work, it does not provide a satisfactory alternative to the fixed point methods. Prompted by this experience, came a move of research in iterative methods for solving variational inequalities and nonlinear complementarity problems which arise often from or in several equilibrium contexts. The finite dimensional variational inequalities, which is a generalization of nonlinear complementarity problems provided a broad unifying setting for the study of optimization and equilibrium problems and serves as the main computational framework for the practical solution of problems in mathematical science. Large number of equilibrium problems arising in economics and transportation science can be studied in the general framework of different variational inequalities.

There are various ways to approach a variational inequality problem. One of the principal ways is to devise an optimization problem whose solution would lead to the solution of the original variational inequality problem. This is done by introducing the notion of a gap function which also plays an important role in the study and analysis of error bounds for variational inequality problems. An error bound is an expression which provides an upper estimate of the distance of an arbitrary feasible point to the solution set of the variational inequality problem. If one can reformulate the variational inequality

problem as an optimization problem then it is easy to solve the variational inequality problem using efficient algorithms for corresponding optimization problems.

The thesis concentrates on constructing new gap functions and developing error bounds for various kind of variational inequality problems including quasi variational inequality problem and inverse quasi variational inequality problem. Towards the end, we also reformulated the time dependent generalized Nash equilibrium problem into one of the evolutionary variational inequality problem.
