

RADIOCHEMICAL STUDIES ON ADSORPTION BEHAVIOUR OF CHROMIUM (VI) ON CERTAIN METAL OXIDES

by

AJIT KUMAR MITRA
Department of Chemistry

***THESIS SUBMITTED
IN FULFILMENT OF THE REQUIREMENTS
FOR THE AWARD OF THE DEGREE OF
DOCTOR OF PHILOSOPHY***

to the
INDIAN INSTITUTE OF TECHNOLOGY, DELHI
INDIA

JANUARY, 1991

DEDICATED

TO MY

MOTHER

CERTIFICATE

This is to certify that the thesis entitled, "RADIOCHEMICAL STUDIES ON ADSORPTION BEHAVIOUR OF CHROMIUM(VI) ON CERTAIN METAL OXIDES" being submitted by Ajit Kumar Mitra to the Indian Institute of Technology, Delhi, for the award of the degree of Doctor of Philosophy in Chemistry, is a record of bonafide research work carried out by him. Mr. Mitra has worked under my guidance and supervision and has fulfilled the requirements for the submission of this thesis which, to my knowledge, has reached the requisite standard.

The results contained in this dissertation have not been submitted, in part or in full, to any other University or Institute for the award of any degree or diploma.

IIT, Delhi

(M.M. Bhutani)
Associate Professor
Department of Chemistry

ACKNOWLEDGEMENT

I express my deep sense of gratitude to Prof. M.M. Bhutani, Department of Chemistry, Indian Institute of Technology, Delhi for his commendable guidance and ever available help throughout the course of this work. Without his critical appraisal, useful suggestions and complete freedom of work, it would have been a difficult task to complete this work successfully.

I gratefully acknowledge the research facilities provided by Prof. N.K. Jha, Prof. B.L. Khandelwal (former Heads of the Department) and Prof. A.S.N. Murthy, Head of the Chemistry Department.

A word of appreciation and special thanks to my colleagues Miss Ramesh Kumari, Sri P. Gopala Krishnan and Sri P.N. Reddy who shared my excitement and disappointments which punctuated the progress of this work.

No work is a whole one by itself. It is a brick in the huge mansion of knowledge. I bow humbly and with a spirit of revercence to each and everyone who has contributed to my work by sharing his ideas via books, Journals etc. As anyone who has worked on a single project for several years knows, there is no way to adequately thank or acknowledge all the people who have helped along the way. For me, the pursuit of a Ph.D. degree has been a vehicle rather than an end in itself. It has brought me

into contact with people with whom I have shared feelings, ideas and much laughter and close friendship I will always cherish. Among these are my friend Basumatary, Bhandari, Thomash, Vinod, Homendra, Panda, Shakti, Purna, Rauthan, Murari, Kaul, Rathi, Raman, Pankaj , Anju and Kavita.

I have special gratitudes to my family members, especially to my late mother who has always been a source of inspiration and encouragement to me.

I thank Shri Narayan Singh for the help in laboratory work, Shri Jagdish Lohia who is an extremely patient and helpful typist and Shri N.S. Gupta for the skill and care he took in tracing the figures.

Amitra

(AJIT KUMAR MITRA)

Abstract

The existence of heavy metals in radioactive waste in aquatic environments has led to much concern over their influence on plant and animal life in these environments and indeed on man's need for wholesome water. Technological advances have greatly increased the use of many metallic elements and increasing amounts of these elements are finding their way into the hydrosphere, and augmenting the 'natural' concentrations. The accumulation of these elements, many of which are highly toxic to animal life, by aquatic plant life and the lower forms of marine animals, is one of man's less praiseworthy influences on the biosphere.

Radioactive wastes are produced wherever radioactive materials are processed or used. The waste is characteristic of the process from which it is derived and may be in a gaseous, liquid or solid form. Special attention may have to be given to waste prior to their release to prevent any injurious effects on public health. Adsorption of chromate ions on manganese dioxide, stannic oxide and vanadium pentaoxide have been investigated at different pH. The findings are explained in the light of deprotonation/hydroxyl ion association reaction on oxide surface and its subsequent interaction with the tracer. The variation in the results is further explained in terms of postulated surface deposition of compounds having low

solubility and dissociability. The lattice as well as non-lattice cations and anions which form soluble complexes with metal ions can either increase or decrease metal adsorption. The infrared spectroscopy has been used to show the existence of chemical interaction between chromate ions and the surface of the hydrous oxide.

The kinetics of adsorption as well as desorption have been studied at different concentrations and temperatures. The kinetic process for both adsorption as well as desorption follows essentially the first order kinetics. A significantly higher value of activation energy for desorption process suggests that the adsorption of chromate ions is more feasible than the desorption process in aqueous solutions under the prevailing experimental conditions.

A radioactive indicator study has also been attempted to examine the feasibility of concentrating the microgram quantity of chromate ions from extremely dilute solutions by subsequent desorption of the activity carried under the optimum conditions. These findings may also find some suitable applications in connection with the problems dealing with the disposal of radioactive waste at low concentration level.

List of Figures	(vii)
List of Tables	(ix)
Abstract	(xii)

CHAPTER 1

Introduction	1-59
1.1 Chemistry, Transformation and Transport of Chromium in Aquatic Environment: Sources of Heavy Metals in Environment	7
1.2 Concentration and Speciation of Heavy metals in Natural Waters	10
1.3 The Carrier Action-Variou Types	17
1.4 Mixed Crystal Formation	19
1.5 Anomalous Mixed Crystal Formation	21
1.6 Adsorption	22
1.7 Classification of Adsorption	23
1.8 Internal Adsorption	26
1.9 Carrying by Preformed Precipitate	27
1.10 Adsorption by Counter Ion Exchange	31
1.11 Carrying by Isomorphous Replacement	32
1.12 Influence of Time on Carrying	33
1.13 Nature of Adsorption Centres in Ionic Solids	34
1.14 Influence of Foreign Ions on the Carrying Process	34
1.15 Effect of Complexing Ligands	36

1.16	Effect of Metals	37
1.17	Adsorption Stoichiometry	38
1.18	Adsorption Isotherms	40
	(a) Influence of Concentration	40
	(b) Influence of Temperature	43
1.19	General Characteristics of the Carriers	43
1.20	The Selected Solids as Carriers	44
	(a) Manganese Dioxide	44
	(b) Stannic Oxide	45
	(c) Vanadium Pentaoxide	45
1.21	Scope and Object of Present Investigation	47
	References	49
 CHAPTER - II		
	Materials and Methods	60-72
2.1	Materials	60
2.2	Instruments	61
	(a) For Radioactivity Measurement	61
	(b) For pH Measurement	61
	(c) For Centrifugation	62
	(d) Water and Glassware	62
	(e) Specific Surface Area	62
2.3	Experimental Methods	62
2.4	Measurement of Carried Radioactivity	63
2.5	Correction of the Gross Counting Rates	65
2.6	Precaution Against Wall Adsorption and Radiocolloid Formation	65

2.7	Control of pH and Temperature	66
2.8	Adsorption Kinetics	67
2.9	IR Studies	70
	References	72

CHAPTER - III

	Results and Discussion	73-112
3.1	Effect of pH and Ionic Concentration	73
3.2	Effect of Interfering/Complexing Cations and Anions	92
3.3	Effect of Cations	93
3.4	Effect of Anions	97
3.5	Effect of Time of Contact of the Tracer with Carrier	101
3.6	Infrared Studies	102
	References	109

CHAPTER - IV

	Kinetic Study	113-155
4.1	(a) Concentration Dependent Adsorption	113
	(b) Experimental	116
	(c) Results and Discussion	117
4.2	Temperature Dependent Study	126
4.3	(a) Desorption Study	136
	(b) Experimental	138
	(c) Results and Discussion	139
4.4	Calculation of Thermodynamic Parameters	146
	References	151

CHAPTER - V

	Possible Use of the Deposition Study of ^{51}Cr Ions on Preformed Carriers (MnO_2 , SnO_2 & V_2O_5)	156-179
5.1	Introduction	156
	(i) Removal/Separation of Ions from Solutions	157
	(ii) Feasibility of Concentrating $^{51}\text{CrO}_4^{2-}$ Species	157
5.2	Working Conditions for the Concentration Procedure	158
	(i) Carrying Efficiency as a Function of pH of the Aqueous Medium	159
	(ii) Adsorption Efficiency as a Function of Lead Ion Concentration	159
	(iii) Carrying Efficiency as a Function of Amount of Carrier	159
	(iv) Carrying Capacity of Adsorbents	163
	(v) Extraction of Adsorbed Activity	163
5.3	Concentration of Cr(VI) Tracer	166
5.4	Disposal of Radioactive Waste at Low Concentration Level	171
5.5	Ion Exchange and Adsorption	173
5.6	Sampling the Environment for the Measurement of Radioactive Contamination	176
	References	178
	Summary	180
