

STUDIES ON CARBON NANOFIBER REINFORCED POLYPROPYLENE COMPOSITES

by

SANGITA NANDI

Centre for Polymer Science and Engineering

Submitted

in fulfillment of the requirements of the degree of Doctor of Philosophy

to the

INDIAN INSTITUTE OF TECHNOLOGY, DELHI

AUGUST 2008

CERTIFICATE

This is to certify that the thesis entitled “**Studies on Carbon Nanofiber Reinforced Polypropylene Composites**” being submitted by **Ms. Sangita Nandi** to the Indian Institute of Technology, Delhi, for the award of degree of **Doctor of Philosophy**, in Polymer Science and Technology, is a record of bonafide research work carried out by her. Ms. Sangita Nandi has worked under my guidance and supervision and has fulfilled the requirements for the submission of this thesis, which to my knowledge has reached the requisite standard.

The results contained in this thesis are original and have not been submitted, in part or full, to any other University or Institute for the award of any degree or diploma.

(Anup K.Ghosh)

Professor & Head

Center For Polymer Science & Engineering

Acknowledgement

It is a pleasant aspect to express my deep sense of gratitude to all who have helped me along my way through the doctoral studies and a memorable stay at IIT Delhi. There are, of course, very few words to properly thank all of them.

My foremost thanks go to my supervisor Prof. Anup K Ghosh. I am deeply indebted to him for his mentoring, able guidance, stimulating suggestions and inspiring thoughts, which have been of tremendous help for me throughout my doctoral studies. He has always been there, through every thick and thin and encouraged me to move forward in life. I truly appreciate his patience and tolerance during my numerous misadventures. I appreciate and acknowledge his help in developing my self-confidence and sense of autonomy. I hereby very frankly confess that the present research endeavor would not have seen the day's light without the esteemed guidance and support of my supervisor.

I would also like to thank other members of my Ph.D committee Prof. Veena Choudhary, Prof. A. K. Gupta and Prof. A. R. Ray who provided me with valuable suggestions and advice. I am also thankful to Prof. S. N. Maiti, Prof. I. K. Varma, Prof. Harpal Singh, Dr. Mangla Joshi, Dr. J. Jacob and Dr. B. Satapathi for their support.

My sincere thanks to Prof. Ashok Misra and Dr. A. R. Bhattacharya, IIT Bombay as they have been supportive in providing me some of their facilities to improve the quality of this research work.

I would like to acknowledge Dr. Anand Tadas and Mr. Pravesh Gupta, AIMIL Ltd. India and Malvern Instruments Ltd. UK for providing me the experimental facilities during this research work.

My special thanks to Mr. Devander Singh, Mr. Surender Sharma, Mr. Ashok Kapoor, Mr. Shivkant and all official staffs of CPSE for their immediate help whenever needed. Also I sincerely thank to Mr. Devender of Physics Department, IITD who has always helped me in the best possible way he could.

My colleagues and friends, Joy, Ananthapadmanabha, Kavita, Senthil, Dilip, Prasath Balamurugan, Prakashan, Dipti, Pooja, Neetu, Purnima, Kamini, Geeta, Snehi, Satpal, Saikat, Manas, Satish, Mayank, Piush, Wazed, Sandeep, Sohail supported me in my research work. I wish to thank them for all their constant help, support, interest and valuable hints. A very special thanks to Ranjan for all his support. Thanks to Pramila and Aditi for taking care of thesis illustrations and processing my official documents. .

I am grateful to various people who have not been directly involved in this project described in this thesis, but with whom I have been in touch during my Ph.D study. Thanks to Dr. Shashi Motilal and Dr. Madhimita Saroop for the views and discussion that helped me to keep the universal spirit that is essential for scientific research.

I am deeply indebted to my beloved parents (Mr. Bibhas Nandi and Mrs. Menoka Nandi) who are at the back of my each and every movement. I wish to record my sincere appreciation and thanks to them for their invaluable support, patience and encouragement throughout my study years. I am also thankful to my sister, Swetasri, who in spite of being younger to me had always been a supportive hand.

A very special thanks to my parents-in-laws (Mr. Atindra Nath Sen and Mrs. Meera Sen) for everything. It's a joy and pride to be their daughter-in-law. They ceaselessly and tirelessly encouraged me with all their love and support and let me freely do whatever I wanted to. Without them, there is no way in which I could possibly have accomplished this stupendous task. Their understanding of the value of education is truly beyond my comprehension.

I cannot forget to mention the name of my little son 'Apratim' who had been a constant source of enthusiasm and ecstasy by his sweet smile.

Lastly I'm left with lack of words to acknowledge my strength, motivation and stable force, my better half 'Anindya'. He has an deep influence on my ability to see and understand my path of self-awareness, for all the pains he bore to make me smile, helped me to take the pressure for the completion of this thesis and more of this, always stood by me with a smile during the storms of momentary depression,

Finally, thanks to GOD for HIS impeccable guidance and support, which helped, me to remain focused even in many obstacles that came during the course of this journey.

Abstract

Carbon nanofibers (CNF) have attracted attention due to their one-dimensional structure, excellent electrical and thermal conductivity, together with their excellent mechanical properties. These novel properties of CNF have generated scientific and technical interest in the development of nanofiber-reinforced polymer composites. The performance of a composite depends largely on the dispersion behavior of the filler in polymer matrix, which depends primarily on the properties of the matrix and filler, the surface characteristics of the filler, the interface between the two components as well as the mode of stress transfer at the interface. In case of nanofillers, the dispersion presents great challenges due to their extremely small dimensions, high surface areas, and high surface energies. The dispersion of the nanofillers in polymer matrix depends on filler characteristics, interfacial properties, entanglement state of the as-received nanofibers and the flowability of the matrix resin as well as on processing conditions. Thus, evaluation of processability of these nanofiber composites becomes important to understand both the processing behavior as well as state of dispersion.

The composites based on three different MFI grades of polypropylene (PP) were prepared in a DSM conical twin-screw microcompounder using 2%, 5% and 8% CNF concentration at 220⁰C. The processability of carbon nanofiber (CNF) filled PP composites was analyzed through torque rheometry and oscillatory rheological studies. Dispersion of CNFs in polypropylene matrix during processing was studied w.r.t. CNF content, melt flow index (MFI) of PP, processing time and screw rpm. Attempts were made to correlate torque rheometry, morphology development and electrical resistivity to

study the dispersion of CNFs during compounding. Increasing CNF loading from 2% to 5% resulted in 8 order of magnitude reductions in surface resistivity, which indicated an electrical percolation threshold at 3.5 wt% of CNF.

The melt rheological analysis of the PP/CNF composites was performed in a parallel plate rheometer at different temperatures and a frequency range of 0.05 to 50 Hz. The influence of frequency, temperature and nanofiber content on complex viscosity, storage and loss moduli and damping behavior was investigated. A shear thinning behavior at high frequencies was observed for all the compositions. Both the viscosity and modulus increased significantly at low frequencies for CNF loading more than 2wt%, suggesting an onset of pseudo-solid-like behavior due to the formation of interconnected network of CNFs (rheological percolation). The crossover frequency approached to lower value with CNF loading, which indicated higher relaxation time for the composites due to restrictions imposed by CNFs on the matrix flow behavior. Lower rheological percolation threshold as compared to electrical percolation threshold is due to the fact that denser CNF network is required for electrical conductivity, while a less dense CNF network can impede the motion of polypropylene chain.

Thermogravimetric analysis of the composites showed the samples to have negligible moisture uptake and an enhancement in resistance to thermal degradation as compared to those of the unfilled PP samples. The melting temperatures of the composites showed a slight increase as compared to unfilled PP. The non-isothermal crystallization kinetics studies indicate that the addition of CNF led to an increase in the rate of PP crystallization with no change in nucleation mechanism, as analyzed by the Avrami method. Both the Jeziorny method and Mo method described the crystallization

kinetics of composite satisfactorily. Moreover, the method proposed by Kissinger was used to evaluate the activation energy of the composites. The results showed that the activation energy of the composites decreased with increasing CNF content as well as with decreasing MFI of PP.

The tensile modulus and yield strength were found to increase with increasing concentration of CNF while elongation % decreased irrespective of MFI of PP. Although flexural modulus showed an increasing trend with CNF loading but flexural strength remain relatively independent of CNF content. Both the storage modulus (G') and loss modulus (G'') increased in presence of higher CNF concentration. Although T_g was not affected much and remained almost independent of nanofiber loading, but $\tan\delta$ peak became significantly broadened in presence of CNF. In general, composites based on lower MFI grade (higher molecular weight) yielded superior composite properties as compared to composites made from higher MFI grade polypropylene.

Achieving appropriate fiber/matrix adhesion is the key to imparting good mechanical properties to a polymeric composite. In order to improve the nanofiller/matrix interactions, functionalization of the nanofiller surface is essential. The functionalization of CNFs could enhance their chemical compatibility with the matrix and hence dispersion and interfacial properties are expected to improve. In this research, the chemical modification was carried out by refluxing the as-received CNF in a mixture of conc. sulphuric acid and conc. nitric acid (1:9, v/v) at 100⁰C with constant stirring for different chemical treatment time. The oxidized CNF (O-CNF) was purified and characterized by FTIR spectroscopy, NaOH titration, Methylene blue adsorption and morphological analysis. The results suggest that acid oxidation leads to fiber surface etching and the

CNF lengths decreased drastically with oxidation time. The composites of 2 wt% O-CNF and PP were prepared in presence of 2 wt% of maleic anhydride grafted PP compatibilizer. The thermal, mechanical and electrical properties were evaluated and compared with those of composites made with untreated CNF. Studies on crystallization behavior indicated the nucleating action of both unmodified and chemically modified CNF. Thermogravimetric analysis indicated an increase in thermal stability of the composites. The electrical conductivity was lower than untreated CNF and was decreased with chemical treatment time because oxidation process probably damage graphitic structure of CNF and caused less number of π -electron available for electron transport. In case of O-CNF based composites, the aspect ratio was reduced due to oxidation and consequently, caused a reduction in tensile and dynamic mechanical properties.
