

PHASE CHANGE MATERIALS FOR THERMAL ENERGY STORAGE

BY
SHASHIKALA SEHGAL

A thesis submitted in fulfilment
of the requirements for the degree of
DOCTOR OF PHILOSOPHY

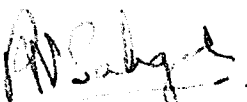

Department of Chemical Engineering
INDIAN INSTITUTE OF TECHNOLOGY, DELHI
INDIA
MARCH, 1985

C E R T I F I C A T E

This is to certify that the thesis entitled "PHASE CHANGE MATERIALS FOR THERMAL ENERGY STORAGE" being submitted by Mrs. Shashikala Sehgal to Indian Institute of Technology, Delhi, for the award of Doctor of Philosophy in Chemical Engineering, is a record of bonafide research work carried out by her. Mrs. Shashikala Sehgal has worked under our guidance and supervision and has fulfilled the requirements for the submission of thesis, which to our knowledge has reached the requisite standard.

The results contained in this thesis have not been submitted in part or in full to any other University or Institute for the award of any Degree or Diploma.

(P. N. Sahgal)
Professor
Deptt. of Chemical Engg.
IIT, New Delhi-110016.

(S. Subrahmanyan)
Lecturer
Deptt. of Chemical Engg.
IIT, New Delhi-110016.

(N. K. Sandle)
Assistant Professor
Department of Chemistry
IIT, New Delhi - 110016.

A C K N O W L E D G E M E N T

The author wishes to express her deep gratitude to Prof.P.N.Sehgal, Dr.S.Subrahmaniam and Dr.N.K.Sandhu, her supervisors, for the advice, help and constant encouragement that they have given throughout the course of this work.

The author acknowledges with thanks the constant help given by the faculty members and co-operation rendered by the fellow research scholars.

Thanks are also due to all the laboratory and workshop staff of the Department for their assistance during the entire work.

Date: 21-3-85.

NEW DELHI.

Shashikala Sehgal
(SHASHI KALA SEHGAL)

ABSTRACT

A brief review of different techniques, both applied and proposed for storing thermal energy has been presented. Considering the states of development of these techniques and their potential applications, Solid-Liquid Transition for thermal storage appears to be very attractive. However, to assist in the rational choice of Phase Change Materials extensive thermophysical properties of candidate materials is required. Literature search indicated lack of such data. After a review of the required properties, it was decided to focus attention on the two major properties, i.e., latent heats of fusion and phase diagrams for mixtures. Various experimental techniques were considered and those of Thermal Analysis and Differential Thermal Analysis were chosen. The scope of the materials studied included organic amides, acids, anhydrides, polyaromatics and halogenated benzene. Among the inorganics, Sodium Nitrate, Potassium Nitrate and their mixtures were used to test the reliability of the apparatus. Experiments with inorganic-chlorides

and their mixtures indicated experimental difficulties due to their high vapour pressure and hygroscopic nature. Hence, further work on these materials was not pursued. The reproducibility and accuracy of the experiments was gratifying. Thus, the phase-diagrams obtained could be accurately predicted by means of the experimentally determined latent heats of fusion using the Van't Hoff's equation. Theoretical considerations on freezing are also presented.
