MOLECULAR DYNAMICS STUDIES OF COMPLEX SYSTEMS: MOLECULAR CHAINS AND IONIC LIQUIDS

by

GOURAV SHRIVASTAV
DEPARTMENT OF CHEMISTRY

Submitted

in fulfillment of the requirements of the degree of Doctor of Philosophy

to the

INDIAN INSTITUTE OF TECHNOLOGY DELHI
MAY 2018

Certificate

This is to certify that the thesis titled “**MOLECULAR DYNAMICS STUDIES OF COMPLEX SYSTEMS: MOLECULAR CHAINS AND IONIC LIQUIDS**” is being submitted by **Mr. Gourav Shrivastav** to the Department of Chemistry, Indian Institute of Technology, Delhi, for the award of the degree of **Doctor of Philosophy**. This thesis is a record of bona-fide research work carried out by him under our guidance and supervision. In our opinion, the thesis has reached the standards fulfilling the requirements of the regulations relating to the degree.

The results contained in this thesis have not been submitted to any other university or institute for the award of any degree or diploma.

Prof. M. Ali Haider

*...to my beloved family and
(Late) Prof. Charusita Chakravarty*

Acknowledgments

Foremost, I thank almighty god to have kept me in form and capability to have reached where I am today. This thesis represents not only my work at the keyboard, it is a milestone in nearly five years of work at IIT Delhi and writing this note of thanks is the finishing touch on my dissertation. I offer my profound and deep respect to **(Late) Prof. Charusita Chakravarty**. I find myself fortunate to have begun my scientific carrier under the guidance of an esteemed scientist of her stature. Although my association with her was limited, imprints of her scientific and human values will always be carried along with me. I would also like to convey my gratitude to **Prof. Ramakrishna Ramaswamy**, School of Physical Sciences, Jawaharlal Nehru University, for all his constant support and guidance throughout my journey.

I would like to express my sincere gratitude to **Prof. Hemant K. Kashyap**, Department of Chemistry, IIT Delhi and **Prof. M. Ali Haider**, Department of Chemical Engineering, IIT Delhi for their continuous support and motivation as my research guides. After the unfortunate demise of Professor Charusita Chakravarty, my research work and ongoing projects were supported by them. This thesis would not have been possible without their active participation. I sincerely acknowledge the unconditional support from them. I would also like to thank the members of my student research committee, Prof. Siddharth Pandey(Chairperson), Prof. Pramit Chowdhury (Internal Expert), Prof. Bodhraj Mehta

(External Expert). I would like to thank CSIR-India for financial assistance as JRF and SRF. I would also like to convey my special thanks to **Prof. M. Ali Haider** and **Prof. S. Basu** for providing the financial assistantship. I deeply acknowledge the Computer Services Center, IIT, Delhi for extensive access to their computational resources and the use of the central HPC facility. I thank IIT, Delhi library, for the journals and books which were very crucial for my research work.

No words of thanks can sum up the gratitude that I owe to Dr. Manish Agarwal for being extremely motivating and supportive throughout my journey. It has been a friendly and cheerful learning experience during all the discussions with him that provided me with valuable insights into various research fields. I would also like to thank Anchal Agarwal to have accelerated my work with Dr. Manish so as to meet the time lines. In addition, I would like to thank (which is not enough) all the members from Renewable Energy and Chemical Lab: Dr. Tuhin, Dr. Imteyaz, Uzma, Shelaka, Fatimah, and Ejaz for all the help, discussions, intellectual talks, and ofcourse coffees. I would also like to thanks my all the seniors: Dr. Murari Singh, Dr. B. Shadrack Jabes, Dr. Divya Nayar, Dr. Debdas Dhabal, Dr. Saurav, Hari O. S. Yadav, Madhulika, and my junior friends Shobha, Aditya, Supreet, Pratibha, and Harender for their timely help.

I would like to thank all my friends Jasmin (jaggu), Rosy (enantiomer), Garima (garry), Shubra (shubi), Vinay (bk), Sandeep (cj), Himanshu (cc) and Rahul for providing me all the positiveness and stress-free environment. In last 5 years, I have relied heavily on Ms. Jasmin Kaur and want to convey my thanks for her extremely important role through out the journey. Finally, I would like thank to my family members: My uncle Sh. B. N. Shrivastav, my aunty Smt. Asha shrivastav, my cousin brothers - Pritosh, Kishan, Amit, Subhash, and Kuldeep. My deep love and affection to my mother Smt. Satyavati Shrivastav

, my father Sh. Ramu Shrivastav and my sisters Kirti and Monika for their unconditional support and care in all stages of my life. They have made me realize the virtues of life.

Thank you very much, everyone!

New Delhi

Gourav Shrivastav

Abstract

The work in the thesis encompasses a molecular dynamics study of systems exhibiting wide variety of complexities in context of both fundamental and industrial applications. The main focus is on developing an understanding of thermodynamic and structural aspects of two important classes of non-aqueous complex fluids: (a) molecular chain fluids with primary focus on alkanes and (b) ionic liquids (ILs). Depending on nature of the system, various analyses are used to probe the structure based on nearest neighbour distribution, such as pair correlation function, triplet correlation function, bond order parameter, single chain order parameter, structure function, spatial distribution function and lateral number density. Among thermodynamic properties, free energy, excess entropy, and isothermal compressibility are calculated. In particular, for alkanes, the concepts applicable to simple liquids are further generalized by using the fluctuation's correlation and semi-quantitative relationships between the thermodynamic excess entropy, structure, and dynamics. Thermodynamic integration method is used to obtain thermodynamic excess entropy. For structural estimation of entropy, both pair and triplet entropies are used. It is shown that alkanes exhibit pseudo-simple behaviour, and the structural and dynamic behaviours are dominated by the packing of monomeric units. Hence, homologous series of n -alkanes, with constant number density of monomeric units, can be used to design similar synthetic solvation environment in a broad range of temperature. We then investigate the thermophysical and

rheological properties of mixtures of alkanes with various other hydrocarbons to mimic the composition of gasoline. The outcomes of adding oxygenates, biomass-derived alkyl levulinates and methyl tertiarybutyl ether, are compared in conventional gasoline and proposed reformulated gasoline. It is shown that alkyl levulinates can be utilized for partial as well as complete removal of toxic aromatics in gasoline. We have then extended our study to examine the stress-strain behaviour for semi-crystalline configurations of mesomeric/polymeric alkane chains, with and without covalently bound hydroxyl groups. Since different crystallinity of the sample may affect their stress-strain behaviour, a simple method is proposed to compute the sole effect of added group without affecting the actual distribution of crystalline, interphase, and amorphous content. It is shown that small amount of hydroxyls, e.g. 4 or 8%, does not have significant effect on mechanical properties of polyethylene. In the case of ILs, the microscopic level knowledge of structure is crucial for understanding of structure-quantity relationships. By studying mixtures of butylammonium nitrate (BAN) with primary alcohols, we have demonstrated how the chain length of the added alcohols changes the nanoscale spatial arrangement of BAN IL. For this, two- and three-body correlations of different species of the mixture were examined. Then, using a room-temperature IL, ethylmethylimidazolium tetrafluoroborate [EMIM][BF₄], the thermodynamic aspects of solvophobic effects in the confinements of nanoscale sheets are discussed. To achieve this, the density fluctuation behaviour is monitored to compute the probability of finding number of heavy atoms in a given probe volume which is subsequently used to estimate the associated free energy. Akin to aqueous conditions, the IL studied also manifests solvophobic effects although it is weaker than water. For similar sized solute, the stable vapor phase within the confinement, forms at lower separation in the IL than that for water.
