Submitted

in fulfillment of the requirements of the degree of Doctor of Philosophy

to the

INDIAN INSTITUTE OF TECHNOLOGY DELHI

SEPTEMBER 2016

*Thesis dedicated to all my
loving friends*

CERTIFICATE

This is to certify that the thesis entitled, “**ORGANOCHALCOGEN LIGATED/STABILIZED PALLADIUM AND RUTHENIUM SPECIES: CATALYSTS FOR ORGANIC REACTIONS**” being submitted by **Mr. SATYENDRA KUMAR** to the Indian Institute of Technology Delhi for the award of the degree of **Doctor of Philosophy**, is a record of bonafide research work carried out by him. Mr. Satyendra Kumar has worked under my guidance and supervision. He has fulfilled the requirements for the submission of this thesis, which to my knowledge has reached the requisite standard.

The results contained in this dissertation have not been submitted, in part or in full, to any other university or institute for award of any degree or diploma.

Date:

New Delhi

Dr. AJAI K. SINGH

Professor

Department of Chemistry

Indian Institute of Technology Delhi

New Delhi-110016

ACKNOWLEDGEMENTS

I feel privileged to convey my earnest gratitude to all those who have broadened their valuable assistance to this thesis in one way or other. This work would not have been possible without their generous support for which I am extremely grateful to them.

Words can never express the indebtedness, but I dare to take this opportunity to pay my deepest sense of gratitude with profound obeisance and sincere gratitude to my Ph.D. supervisor Professor Ajai Kumar Singh, giving the opportunity to join his group. His wide knowledge, logical way of thinking and magnanimous moral support has been of great value for me. It has been a wonderful experience to work in his group during my stay as a student and which helped me to cope with all the situations.

I shall remain ever grateful to the Head, Department of Chemistry for providing necessary research facilities. I acknowledge the help extended by all faculty members during my stay here. Special thanks are to Professor B. Jayram for providing supercomputing facility and Professor A. K. Ganguli for providing HRTEM as well as powder XRD facilities. I thank all technical staff members specially Keshav Sir for their help rendered during this work.

I heartfelt thanks to I. I. T. Delhi for offering me an apotheosis surround in which I felt free and could concentrate on my research. Financial support by the “University Grants Commission” New Delhi, India for the award of JRF and SRF is duly acknowledged.

I also extend my sincere thanks to Dr. Manish Kumar Mishra (from IISc Bangalore), Dharendra Yadav and Pramod Goswami for crystallographic support. I would also thanks to Dr. Goutam Mukherjee for his help in using Gaussian and Density Functional Theory calculations.

I sincerely thank my seniors Dr. Arun Kumar, Dr. P. Singh, Dr. Ved Vati Singh, Dr. Umesh Kumar for their kind support and encouragement.

I would fail in my duties if do not thank my senior Dr. G. K Rao for his valuable guidance and suggestions throughout the course of investigation. I am deeply thankful to Dr. Fariha Saleem, helped me a lot to get this journey done. I believe that those days were more memorable because they were with me.

I would like to give my special token of thanks to my lab colleagues, with them I’ve shared every day during my stay. Dr. Om Prakash, Dr. Kamal Nayan Sharma, Dr.

Hemant Joshi, Dr. Kanchan Chauhan, Alpesh Kumar Sharma, Pooja Dubey, Renu Bhaskar, Mrinal, Anirban, and Ram Sahay Pal for the immense assistance and providing a friendly environment to do work.

I am equally in debt to my dearest friends in IIT Delhi specially Vineet, Saurabh, Soumen, Pramod, Gohil, Arabinda, Kashi, Manoj and Awadh Ji for their cooperation and support. A special thanks to our Ph.D. football club AAFC which made my Ph.D. more joyful and less boring. During our research work, we always found some time from our busy schedules to play football which refresh us.

I would not have been able to get to where I am now without wit and humor of those who kept me somewhat sane during some difficult times. This is the right moment to mention my heartfelt thanks to Dr. Mahabir Pratap Singh, Dr. Manish Kumar Upadhyaya, Daljeet Pratap Singh, Pragati, Deepika and Abhay Kumar Mishra who have been my tower of strength throughout my work so that I am able to see this day deserves a special mention.

It is a tribute to unspoken and unconditional love of my parents. They are who did everything for making my dream come true. My special thanks goes to my brothers Bhupendra, Upendra, Shivendra and sister in laws Poonam and Madhushri. They have put high moral values inside me and made me strong enough to face any obstacle in life. I express my love to my little niece Prisha, she means the world to me and continually inspires me to do better for our family.

Last but not the least I thank almighty.

Satyendra Kumar

ABSTRACT

Palladium and ruthenium complexes of organochalcogen ligands and their applications in catalysis are focus of the thesis. Multidentate organochalcogen ligands **L1**–**L10** of the thesis are depicted below (Chart 1).

Chart 1

The (E, N, E) pincer ligands (ArECH₂CH₂)₂NH (**L1/L2**: Ar = Ph, E = S/Se; **L3**: Ar = CH₃O-*p*-C₆H₄, E=Te) synthesized by reaction of PhS[−]/PhSe[−]/CH₃O-*p*-C₆H₄Te[−] with bis(2-chloroethyl)amine react with Na₂PdCl₄ in aqueous ethanol, resulting in nearly square planar diamagnetic complexes [Pd(L)Cl]Cl (**1–3**), where **L** = **L1–L3**. The single crystal structures (determined with X-ray diffraction) of **2** and **3** have been solved. The **1** and **2** at 2–3 mol% loading show better catalytic activity for Suzuki-Miyaura coupling (SMC) than **3**, as higher yields were observed with them in a relatively short time. The addition of TBAB was essential in some cases to get good yield of cross-coupled product. The SMC appears to be catalyzed with Pd(0) nanoparticles (NPs) generated *in situ* in the course of reaction. The NPs have been isolated and HRTEM studies on them have revealed their size as ~1–3 nm. The isolated NPs show catalytic activity for SMC independently. The two-phase test suggests a relatively low contribution of homogeneous Pd species in the catalysis.

The bidentate 1-(2,6-diisopropylphenyl)-4-(phenylthio/selenomethyl)-1*H*-1,2,3-triazole (**L4/L5**) synthesized by ‘Click’ reaction, reacts with [Pd(CH₃CN)₂Cl₂] and [(η^6 -benzene)RuCl(μ -Cl)]₂ (followed by reaction with NH₄PF₆), at room temperature resulting in complexes [Pd(**L**)Cl₂] (**4** and **5**) and [(η^6 -C₆H₆)Ru(**L**)Cl]PF₆ (**6** and **7**) (**L** = **L4** or **L5**) respectively. Single crystal structures of **4–7** were solved. The geometry of Pd in **4** and **5** is distorted square planar while in case of **6** and **7** there is a pseudo-octahedral “piano-stool” type disposition of donor atoms around Ru. The catalytic activity of complexes **4** and **5** (optimum loading 0.001–2 mol% of Pd) was explored for SMC in water and Sonogashira coupling reactions. For SMC no additive or phase transfer catalyst was added. For catalysis of transfer hydrogenation (TH) of aldehydes and ketones both half sandwich Ru(II) complexes **6** and **7** were explored. Their optimum loading as catalyst was found to be 0.1–0.4 mol % of Ru. In TH both water used as a solvent, and glycerol as a hydrogen source are environmentally friendly. The **4** having sulfur ligand is more efficient than **5** (Se analog) for both SMC and Sonogashira coupling. The activity of **6** and **7** for TH is in the order Se > S.

Monodentate *n*-didocosyl sulfide (**L6**), explored as a protector of palladium nanoparticles (**1-6**) was synthesized by reaction of *n*-bromodocosane with Na₂S, generated *in situ* by reduction of elemental sulfur with NaBH₄. Pd NPs (**1-6**) protected with **L6** were prepared using different palladium precursors in the presence of varying amount of **L6** (Pd : **L6** ratio 1:2 and 4:1). The resulting spherical NPs have been characterized by powder X-ray diffraction, SEM, EDX, UV-Vis, and HRTEM. The maximum number of NPs (**1-6**) has size (nm) in the ranges: ~18-19, 4-5, 5-7, 4-6, 7-9 and 4-6 respectively. The precursor of palladium affects the size, shape and dispersion of the NPs. The reaction of Na₂PdCl₄ with **L6** resulted in complex [Pd(**L6**)₂Cl₂] (**8**). The NPs shows good catalytic activity for SMC of various aryl chlorides/bromides with phenylboronic acid at low

catalyst loading (0.1–0.5 mol % of Pd). The conversion is good for some aryl halides in a short reaction time of the order 1–2 h. The distinct advantage of NPs **1–6** is that they can be separated and reused at least up to five times. The complex **8** equivalent to 0.001 mol % Pd is efficient for SMC of some aryl halides, as good conversion into coupled products has been observed. Two phase test, conducted for complex **8** and NPs **2**, suggests the contribution of both homogeneous and heterogeneous catalytic pathway to overall catalysis.

Quinoline-based unsymmetrical pincer ligands (**L7–L10**) having (O[−], N, E) donor sites (where E = S/Se), and their Pd(II) complexes have been synthesized. The reaction of Na₂PdCl₄ with **L7–L10** results in complexes **9–12** easily. Thioamide based ligands **L9** and **L10** have been synthesized by Willgerodt-Kindler reaction of aldehydes/ketones. Single crystal structures of **L7** and complexes **9** and **10** have been established. The geometry around Pd in **9** and **10** is distorted square planar. Complexes **9** and **10** were explored for SMC. The required catalyst loading 0.1–0.5 mol% appears promising for good conversions of aryl bromides into coupled products. DFT calculations support that experimental results of catalysis and structural features (bond lengths and bond angles) of complexes of **9** and **10**. One pot thermolysis of complex **9** in the presence of TOP/OA+ODE (1:1 mixture) surfactant at moderate temperature results in cubic palladium oxide (PdO) nanoparticles. HRTEM, SEM–EDX and powder XRD have authenticated these NPs. The phase of PdO NPs was authenticated by matching their powder XRD patterns with those reported in JCPDS (Card No. 65–5261).
