DEDICATED

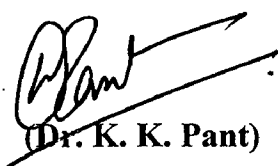

TO

MY BELOVED FAMILY

CERTIFICATE

This is to certify that the thesis entitled, “**DRY REFORMING OF METHANE TO SYNTHESIS GAS OVER K, Ce, Mn PROMOTED Ni/Al₂O₃ CATALYSTS**” being submitted by **Mrs. Nandini A.** to the Indian Institute of Technology, Delhi for the award of Doctor of Philosophy is a record of bonafide research work carried out by her under our guidance and supervision in conformity with the rules and regulations of Indian Institute of Technology Delhi.

The research report and results presented in this thesis have not been submitted, in part or full, to any other university or institute for the award of any degree or diploma.

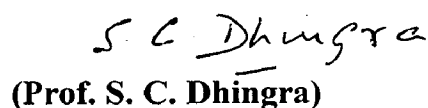

(Dr. K. K. Pant)

ACKNOWLEDGMENT

At this moment, these are the thoughts that come to my mind to express my deep sense of gratitude to Dr. K. K. Pant, Associate Professor, Department of Chemical Engineering, by whose inspiration, keen interest and kind support, I had the opportunity to conduct this study. I shall be indebted to him forever for inculcating within me the qualities of perseverance, confidence and a sense of commitment towards one's work. Without his unconditional support, this task couldn't have been so easy for me. I specially thank him for being kind and considerate towards me throughout the course of this work. It was a fortunate and unforgettable experience to work under his reflective and revered guidance. His endless kindness and incomparable support cannot be thanked adequately here.

I am extremely grateful to Prof. S. C. Dhingra, Department of Chemical Engineering, under whose inspiration, knowledge and kind support, I could carry forward my task to successful fulfillment. His keen faith, constant encouragement and zealous interest in every aspect of my work are wholeheartedly acknowledged.

I am profoundly thankful to Prof S. K. Gupta, Head, Chemical Engineering Department, for providing me with all the necessary facilities during the course of my work.

The encouragement, constant support, critical reviews and important suggestions given by Prof. H. M. Chawla, Prof. B. K. Guha, Prof V. K. Srivastava, Prof. D. Subbarao, Prof. A. K. Gupta and Prof. A. N.

Bhaskarwar throughout my research work are greatly acknowledged. Special thanks are due to Prof. T. R. Rao for allowing me to carry out TGA experiments in his lab. I wish to convey my sincere thanks to Dr. V. V. Krishnan for some fruitful discussions during the compilation of my work. I was fortunate to have an excellent work environment in the laboratory, which facilitated my work to a great deal. For this, I must thank Mr. N. K. Gupta, lab-in-charge, Mr. D. K. Gupta, Mr. Krishan Kumar and Mr. Badri Prasad for their constant help in every possible way to carry forward my research work. I am extremely thankful to Mr. Rajinder Khanna, Mr. Inderjeet Singh, Mr. Dilbagh Singh, Mr. Gulani, Mr. Ram Dev, Mr. Nayak, Mr. Vijay Pal, Mr. Pandey and Mr. Ramesh for their help and assistance rendered with the laboratory facilities during the different stages of the experimental work. I also wish to thank the other faculty members and office staff of the Department.

I am thankful to Arti for her unstinted support, love and concern right from our course work days. Life at IIT, Delhi would have been boring without Vimal and Ajit, true friends in the real sense of the word. Their lively companionship made my research work a really enjoyable experience. Their cooperation, concern and encouragement in their own little ways actually pulled me through the tougher and trying times. I must thank my friends and colleagues Sanjay, Tony, Hasan, Vikrant Sarin and Akanksha for keeping a cordial environment in the lab and providing fruitful suggestions. I would like to thank Sanjay additionally for helping me with the final editing of this thesis. Thanks are also due to Rekha, Senthilmurugan, Hari Shankar, Anand Singh, Jeevarathinam,

Monisha, Subhashini, Arnab, Muthukrishnan, Rajiv Garg, Rajyalakshmi, Nagalakshmi, Divesh, Rohit, Dipti, Ravi Shankar, Debi Prasad and other students for their kind concern and support. I would like to make a special mention of Kanthi Varma who was always there to help me when needed. When one owes so many, it is almost impossible and invidious to single out names. However, I acknowledge my well wishers and friends Dr. Sapna Jain, Dr. Preeti Sahai, Dr. Bina Singh, Dr. Rakesh Srivastava and Dr. Hema Pant for inspiring me throughout my Ph. D. work. The frequent lab get-togethers with all my friends and colleagues brightened up things.

During a three weeks 'Orientation Programme in Catalysis' sponsored by DST, Government of India at the Department of Chemistry, Indian Institute of Technology, Madras at Chennai, India, I had the opportunity of interacting with Prof. B. V. Vishwanathan. He is a teacher par-excellence. His youthful energy after retirement, high moral values, unconditional and unmatched cooperation for the continuous progression of the research work of his students stunned me. I thank him for inculcating in me new ideas related to my work.

I wish to thank all the vendors for their timely help in procuring the equipment I needed for my work. Here I would like to make a special mention of Mr. Aman Gautam (Micromeritics, USA) and Mr. Jadon (AIMIL), who were always there to help me at short notice with their expertise when any equipment failed to perform.

I cannot, but feel indebted towards my parents. Their unconditional and kind support in looking after my son right from his birth to date actually

helped me to work consistently and concentrate on my work. My son Mithils' innocent smile and baby talk was a constant source of encouragement. I am also thankful to my parents - in law, brother and sisters for their constant encouragement and support during my studies.

I will always be indebted to my husband, Pechimuthu for realizing my goals. His continuous optimism, patience and faith from the commencement till the completion of this work are invaluable. I cannot forget his immense support in all odd and even situations. He lightened my burden by sharing my domestic responsibilities. He has been the principal motivating force in this endeavor for which no words of thanks would be sufficient.

I would also like to thank my critics who have unknowingly helped me to come out as a better professional and individual.

Herewith I would like to thank all of those, who have directly or indirectly contributed to the realisation of this thesis.

Last but not the least, a note of heart felt devotion to GOD, who has made me capable of accomplishing this uphill task.

Nandini P.
(NANDINI A.)

ABSTRACT

Carbon dioxide reforming of methane into synthesis gas (syngas), which converts two of the cheapest carbon-containing gases (CH_4 and CO_2) into a useful chemical product, has received considerable attention during recent years. The reaction is particularly interesting when natural gas is composed of methane and CO_2 . In the present investigation catalytic reforming of methane with carbon dioxide into syngas over $\text{Ni}/\gamma\text{-Al}_2\text{O}_3$ catalysts modified by potassium, MnO and CeO_2 has been studied. The catalysts were prepared by wet impregnation technique and were characterized by N_2 adsorption/desorption isotherm, BET surface area, pore volume, BJH pore size distribution measurements, X-ray diffraction, scanning electron microscopy, transmission electron microscopy, temperature programmed studies and pulse chemisorption. The performance of these catalysts was evaluated by conducting the reforming reaction in a fixed bed reactor. The amount of carbon deposited on the catalysts during an experimental run was determined by oxidation in air conducted in a thermogravimetric analyzer. Results of the investigation suggested that stable $\text{Ni}/\text{Al}_2\text{O}_3$ catalysts for the carbon dioxide reforming of methane can be prepared by the addition of both potassium and CeO_2 (or MnO) as promoters. The results of the various characterization techniques were used to relate the observed catalytic activity and stability to the catalyst property. The stability and lower amounts of coking on promoted catalysts were attributed to partial coverage of the surface of nickel by patches of promoters, strong metal-support interaction and to their increased CO_2 adsorption.

For the stable $13.5\text{Ni}-2\text{K}/10\text{CeO}_2\text{-Al}_2\text{O}_3$ catalyst, the effect of reaction temperature, contact time and feed ratio on conversion and product yield was studied. It was found

that the conversion and product yield increased with increasing reaction temperature and $W/F_{CH_4,0}$ and reached equilibrium at $W/F_{CH_4,0} = 1.7 \text{ kg}_{\text{cat}}\cdot\text{h}/\text{kg}_{\text{methane}}$. Conversion of CH_4 increased with the increase in feed ratio of CO_2/CH_4 . An equimolar amount of H_2 and CO was produced at a CO_2/CH_4 ratio of 1.0. At a higher feed ratio, the yield of H_2 decreased because some H_2 reacted with excess CO_2 through the reverse water-gas shift reaction. The kinetic behaviour of the $13.5Ni-2K/10CeO_2-Al_2O_3$ catalyst in the reforming reaction was investigated as functions of temperature and of partial pressures of CH_4 and CO_2 . The apparent activation energy for CH_4 & CO_2 consumption and H_2 & CO production were 46.1 ± 2.5 , 46.2 ± 2.4 , 54.0 ± 2.6 and 47.4 ± 1.7 kJ/mol, respectively. It was found that an increase of the H_2 partial pressure leads to a continuous enhancement of the rate of CO formation and CO_2 consumption, due to the simultaneous occurrence of the water-gas shift reaction; whereas methane conversion remained almost constant. The rate of methane consumption is strongly affected by the partial pressure of methane. Variation of the CO_2 partial pressure has a strong influence on the rate of methane consumption at low partial pressures of 0-0.1 atm, while it is insensitive to CO_2 partial pressure at high pressures. The dependencies of the rates of H_2 & CO formation and CH_4 & CO_2 consumption on the feed partial pressure of CH_4 and CO_2 were determined using a power rate law: $r_i = k p_{CH_4}^a p_{CO_2}^b$. The results suggested strong adsorption of CO_2 on the catalyst surface, (i.e. surface of the catalyst is favourably saturated with carbon dioxide), thus decreasing CO disproportionation.

A mechanism of the CH_4/CO_2 reaction has been proposed based on the experimental results and literature review. The proposed mechanism for the CH_4-CO_2 reforming reaction assumes that (i) CH_4 decomposition and CH_xO decomposition are the slow kinetic steps; (ii) CO_2 participates in the reaction mechanism through the reverse water-gas shift to produce surface OH groups, and (iii) surface OH groups react with

adsorbed CH_x intermediates to yield methyl formate intermediate, CH_xO , which decomposes to yield H_2 and CO . The kinetic model, which is based on this mechanism, predicts satisfactorily the kinetic results. The activation energy for methane adsorption and dissociation was estimated to be 107.2 ± 3.0 kJ/mol.

The activity of 13.5Ni-2K/10CeO₂-Al₂O₃ catalyst was also tested for 60 h time on stream (TOS) for the dry reforming of methane at three different temperatures (650, 700 and 750 °C). No appreciable deactivation was observed for the catalyst at all the three temperatures for the 60 h run. Results of the deactivation study suggested that both CH₄ cracking and CO disproportionation contribute to coke deposition. The spent catalysts were characterized by BET surface area, XRD, TEM and XPS analysis to understand the morphology of the coke deposited on the catalyst. XRD patterns showed that carbon formed on 13.5Ni-2K/10CeO₂-Al₂O₃ after 60 h TOS at 700 and 750 °C dispersed well and could not be observed, while after 60 h TOS at 650 °C, mainly graphitic carbon (peak at $2\theta = 26.3^\circ$) formed. XPS characterization demonstrated the existence of mainly two kinds of carbon species, graphitic (-C-C-) and oxidized carbons (-C-CO-, CO₃). The qualitative analysis of coke deposited on the catalyst suggested that some carbon species formed on the surface of the catalyst must be involved in the reaction to produce CO. A large part of the graphitic carbon deposited on the catalyst surface was of the filamentous form with nickel on top of these carbon filaments. This form of graphitic carbon is more active in the reforming reaction of methane, probably due to its close contact with nickel particles. The activation energy value for coke oxidation for the 13.5Ni-2K/10CeO₂-Al₂O₃ catalyst was estimated to be in the range of 110-160 kJ/mol.
