CERTIFICATE

This is to certify that the thesis entitled "BIOSORPTION OF CATIONIC DYES FROM AQUEOUS PHASE USING VIRGIN AND IMMOBILIZED FUNGAL BIOMASS" by Nityanand Singh Maurya submitted to the Indian Institute of Technology, Delhi, India, for the award of the degree of Doctor of Philosophy in Civil Engineering Department is a record of bonafide research work carried out by him under my supervision and guidance. The thesis work, in my opinion, has reached the standard fulfilling the requirements for the Doctor of Philosophy Degree. The research report and results presented in this thesis have not been submitted in part or in full to any other University or Institute for the award of any degree or diploma.

(Dr. A.K. Mittal)

Dated: 11/07/2005

Indian Institute of Technology,

New Delhi-110016, (India)

ACKNOWLEDGEMENTS

I take this opportunity to express my deep sense of gratitude and regards to my esteemed supervisor Dr. A.K. Mittal for his able guidance, untiring attention and constant encouragement throughout the research work reported in this thesis. The association with him was enormously beneficial in many ways apart from academic point of view that cannot be described in words.

I am very much thankful to Prof. M. Khare, Dr. B.J. Alappat and Dr. A.K. Nema for their valuable comments and suggestions at every stage of my work.

I got much needed help and encouragement from a host of friends whose individual names cannot be reckoned here in a single page acknowledgement. In addition, there is a long list of supporting technical and non-technical staffs of Environmental lab and from various departments of the institute without their help it would not be possible for me to complete this work. I am very much indebted to all of them without mentioning their name who helped from behind the scene.

Last but not the least, I am really indebted to my parents for their constant encouragement whenever I become desperate or felt any trouble. I am also thankful to my brother Abhayanad and brother- in-law Dr. Kumar Sanjeev for their endeavor to keep me upbeat. Finally, this acknowledgement will remain incomplete if I miss to express my special thanks to my wife, Poonam and my daughter Priyanshi for their support in silence.

(Nityanand Singh Maurya)

ABSTRACT

In the present work, uptake of dyes using biosorbents prepared from dead macro fungi (*Fomes fomentarius* and *Fomitopsis carnea*) was evaluated. The biosorbent KL, prepared from *Fomitopsis carnea*, which showed high dye uptake potential, was selected for the preparation of immobilized biosorbent. This biosorbent was immobilized using polyvinyl alcohol (PVA) to produce four immobilized biosorbents KI1, KI2, KI3 and KI4 having varying concentration of PVA and virgin biosorbent. Eleven cationic dyes from different chemical classes were evaluated for their sorption on to the biosorbents. Safranin O and Alcian Blue were used for detailed equilibrium and kinetic investigations. Parametric studies like effect of temperature, pH and ionic strength were carried out for uptake of these dyes using both virgin and immobilized biosorbents.

Surface of biosorbents is different from conventionally used adsorbents, i.e., activated carbon. A kinetic model, based on active available binding sites (AABS) was proposed. The performance of the proposed model (Proposed Biosorption Kinetic, PBK) was compared with the other existing kinetic models like Second Order, Lagergren's equation, Pore-Diffusion, and Furusawa and Smith. These models were evaluated under various environmental conditions, and the kinetic constant was determined under various environmental conditions (mixing speed, temperature and biosorbent dose) employing both the biosorbents KL and KI1. Results indicated that PBK model generated kinetic profiles could match the data more closely as compared to Lagergren's equation, Pore-Diffusion, and Furusawa and Smith. Though, same kinetic profile was obtained for Second Order model and PBK model, they provided different values of model constants. Interaction between dye cation and the biosorbent was evaluated using desorption studies, temperature studies (isotherm and kinetics) and FT-IR studies.

The increase in dye uptake potential of biosorbents with pH of dye solution indicated the possibility ion exchange type of dye sorption mechanism. Increased ionic strength led to decrease in dye uptake capacity. It also indicated the possibility of ion exchange as dominating sorption mechanism. However, increase in Langmuir saturation

capacity with temperature indicated chemical sorption type interaction. Desorption of dye was more by mineral acid as compared to acetic acid. Therefore, desorption studies also indicated the possibility of ion exchange as a dominating dye sorption mechanism. However, in case of interactions of Safranin O with KL, FT-IR indicated a combination of chemical and ion exchange as dye sorption mechanism. This was also supported by the values of the heat of adsorption (10.39 to 21.30 KJ/g-mole) and activation energy (20.43 to 48.34 KJ/g-mole).

Key words: Biosorption, cationic dyes, macro fungus, immobilization, isotherm, kinetics and kinetic model development, FT-IR.
