

**DEVELOPMENT OF SOLAR-BIOMASS HYBRID DRIER AND
STUDIES ON
HEAT AND MASS TRANSFER FOR DRYING OF SPICES**

By

JAI SHREE PRASAD nee SOLANKI

Centre for Rural Development and Technology

Submitted

in fulfillment of the requirements of the degree of

Doctor of Philosophy

to the

**Indian Institute of Technology, Delhi
2005**

DEDICATED

to

MY

HUSBAND

Certificate

This is certified that the thesis entitled **“DEVELOPMENT OF SOLAR-BIOMASS HYBRID DRIER AND STUDIES ON HEAT AND MASS TRANSFER FOR DRYING OF SPICES”** being submitted by **Ms. Jai Shree Prasad nee Solanki** to the Indian Institute of Technology, Delhi is worthy of consideration for the award of the degree of **‘Doctor of Philosophy’** and is a record of the original bonafide research work carried out by her under my guidance and supervision.

The results contained in the thesis have not been submitted, in part or full, to any other university or institute for the award of any degree or diploma.

Dr. V.K. Vijay

Assistant Professor

Centre for Rural Development and Technology

Indian Institute of Technology

Hauz Khas, New Delhi 110 016

Date: June 9, 2006

Acknowledgements

It is great pleasure to submit my sincere gratitude to the Almighty for fulfilling my research work. I am profoundly thankful to him for giving me strength to sustain pressure and for equipping me with patience and high spirits throughout this work.

Over flowing with gratitude, I wish to acknowledge all the people who have contributed in completion of this study. Sometimes feelings from the core of heart when moulded into words seldom convey what one truly wish to express.

I express my deepest sense of gratitude to my supervisor Dr. V.K.Vijay for his constant inspiring guidance, untiring efforts and utmost cooperation at every stage in successful completion of this research work.

Beginning with the formulation of research problem, till date I have been especially privileged one to receive guidance from Prof. G.N.Tiwari and Dr. V.P.S Sorayan whose academic excellence and constant encouragement steered me through the work all the way all the time. I would seize the opportunity to express my deep sense of gratitude for their encouraging guidance, motivational urge, valuable analysis, which instilled in me immense confidence to accomplish my goal.

I am very much thankful to Prof. (Mrs.) Santosh Satya, Head, Centre for Rural Development and Technology (CRDT) for her encouragement and for providing necessary facilities for conducting the present research work. My sincere thanks to Prof. R.C.Maheshwari, Dr. S.N. Naik, Dr. (Mrs.) Satyavati Sharma and other faculty members of CRDT, laboratory and office staff of the center for their kind support and timely help in completing my research work.

It gives me a great pleasure to offer my thanks to Mr Parag and Ms Manjula P. Madhvan many others for their valuable and encouraging suggestion, valuable assistance timely help throughout the course of thesis writing.

I fail in my attempt to confide the infinite immaculate entitles of deeds of my parent's in-law into a mere frame of ephemeral code of language. Silence grows into the horizon of wisdom and with that unexplainable silence; I owe my parents, brothers, sisters-in-law who had been incessantive source of love and affection and whose consistent moral boost made this work possible. My word power fails to express my deepest sense of feeling for my beloved husband **Captain Akhilesh Prasad** whose unending love, companionship, sacrifice, endless tolerance, conscience, and constant encouragement boosted my moral and without his whole hearted cooperation this work would never have been possible.

Last but not least my extent obligation to Mrs. Vijay for her hospitality throughout my stay in Delhi.

New Delhi

(JAI SHREE PRASAD nee SOLANKI)

Drying is an important process required for crops, vegetables, fruits and other medicinal herbs for safe storage. Conventional as well as non-conventional energy sources are used for drying. Solar energy is the most common non-conventional energy source for drying in rural areas. There are some limitations of using solar energy for drying which can be overcome by biomass energy. Very limited work on crop drying with solar-biomass energy has so far been carried out in India.

A survey conducted in Saharanpur (Uttar Pradesh) in India revealed the problems faced by rural people for drying of spices and medicinal herbs. The survey reveals that in spite of their hard work in collecting and processing of these plants, they are not getting fair monetary returns. There is lack of adequate drying system and the method commonly used for crop drying i.e. open sun drying does not yield good quality products.

Considering these problems a solar cabinet drier coupled with a biomass stove was developed. The hybrid system consists of a single glazed solar cabinet above a biomass unit. During daytime, solar energy was utilized and in night biomass energy was used for drying of crops kept in the cabinet drier. This solar-biomass hybrid drying system overcomes the limitation with use of solar energy in crop drying i.e. its dependence on nature. The drying processes have been carried out under the three modes of drying i.e. (i) solar-biomass hybrid drying (ii) solar drying (iii) open sun drying and their comparative performance and efficiency was evaluated based on various factors.

Experiments were conducted on drying of ginger (*Zingiber officinale*) and turmeric (*Curcuma longa*.) considering the three factors (crop thickness, crop treatment and climatic conditions) to evaluate the performance of the hybrid system. The hybrid system

extended the working time of the solar drier and resulted in good quality of the dried products due to continuous drying of crop. Experiments were also carried out with solar drying and open sun drying of ginger and turmeric for comparison. In the solar and open sun drying, some cracks were developed within the dried product due to thermal stresses resulting from alternate heating and cooling of the crops during day and night. Quality of the dried product was not good in open sun drying.

Convective, evaporative and radiative heat and mass transfer coefficients were evaluated in all the three modes for drying of ginger and turmeric. It was observed that values of these heat and mass transfer coefficients differ from crop to crop, mode of drying and certain other factors. The results are based on Dunkle's model with rigorous experimental study for all the three modes.

Overall thermal efficiency was determined under the three drying modes considering the three factors viz. thickness, crop treatments and climatic conditions and found that these factors significantly affect drying efficiency of the system. Efficiency was highest for solar drying followed by solar-biomass hybrid drying and open sun drying.

Quality analysis of the crops was made in terms of their volatile oil content, total ash, acid insoluble ash, water-soluble extractives and alcohol-soluble extractives. Curcumin content of turmeric was also determined. The results were compared with the standard values as per Bureau of Indian Standards. Microbiological analysis of the crops was performed for total plate count and yeast & mould count.

The present design of the solar-biomass hybrid drier is simple in construction, low in cost and can be fabricated by rural farmers. The economic evaluation shows that the

proposed hybrid system is technically feasible and economically viable. This simple drier assists in value addition of the crops at primary level. It also offers better monetary returns to the farmers apart from employment generation in rural areas.

Organization of Thesis

Chapter 1 contains role of energy in socio-economic development, limitations of nonrenewable sources of energy and solar energy as well as prospect of solar and biomass energy as the major renewable energy sources and their potential in India particularly for crop drying. It further contains the information about medicinal plant wealth of India, commercial potential of spices and their drying. Relevant information about the two crops selected for the present study i.e. ginger and turmeric has also been mentioned. Basics of heat and mass transfer have also been described.

Chapter 2 presents detailed literature review regarding solar energy-based crop drying systems, theory of heat and mass transfer coefficients, earlier studies on these coefficients, thermal efficiency of the drying systems, quality aspects of spices and cost economic analysis. Experimental uncertainty in terms of percent uncertainty has also been discussed in this chapter.

Chapter 3 contains informations on field survey, details of development and operation of solar-biomass hybrid drier, drying parameters, different factors and cases in the present study along with methodology and observation tables of all the experiments.

Chapter 4 reveals the findings of the field survey, results and discussion of drying time, heat and mass transfer coefficients, per cent uncertainty, thermal efficiency, quality analysis and cost economic analysis.

Chapter 5 presents the conclusions that have been drawn based on the results of the study and accordingly some recommendations have been made. Further scope as well as some limitations of the present work have also been mentioned.

	3.3.2	Temperature	61
	3.3.3	Humidity/Relative humidity	62
	3.3.4	Air velocity	63
	3.3.5	Weight	63
3.4		Operation of the Solar-Biomass Hybrid Drier	63
	3.4.1	Working principle of the solar-biomass hybrid drier	64
	3.4.2	Thermal efficiency of the solar-biomass hybrid drier	65
3.5		Different Factors and Drying Modes in the Present Study	65
	3.5.1	Different factors	66
	3.5.2	Different modes of drying	67
	3.5.2.1	Solar-biomass hybrid drying (Case I)	68
	3.5.2.2	Solar drying (Case II)	69
	3.5.2.3	Open sun drying (Case III)	69
3.6		Experimentation and Observations	74

Chapter IV

RESULTS AND DISCUSSION			76 - 144
4.1		Findings of the Field Survey	76
4.2		Comparison of Drying Time and Weight Reduction of Ginger and Turmeric under Different Modes of Drying	77
	4.2.1	Drying time of ginger in solar biomass hybrid mode (Case I)	77
	4.2.2	Drying time of ginger in solar mode (Case II)	80
	4.2.3	Drying time of ginger in open sun mode (Case III)	81
	4.2.4	Drying time of turmeric under the three modes	83
	4.2.5	Comparison of reduction in weight of ginger under different modes of drying	83
	4.2.6	Percent decrease in drying time under the three modes with the three factors	84
4.3		Variation in Drying Parameters at and across Trays	85
	4.3.1	Variation in moisture content and temperature of the crop at different tray levels	85
	4.3.2	Crop temperature and velocity of air across the tray	87
4.4		Computation of Heat and Mass Transfer Coefficients under Different Modes	88
	4.4.1	Heat and mass transfer coefficients in solar biomass hybrid drying of ginger (Case I)	88
	4.4.1.1	Convective heat transfer coefficient (h_c)	89
	4.4.1.2	Evaporative mass transfer coefficient (h_e)	91
	4.4.1.3	Radiative heat transfer coefficient (h_r)	92
	4.4.2	Heat and mass transfer coefficients in solar drying of ginger (Case II)	94
	4.4.2.1	Convective heat transfer coefficient (h_c)	94
	4.4.2.2	Evaporative mass transfer coefficient (h_e)	95

4.4.2.3	Radiative heat transfer coefficient (h_r)	95
4.4.3	Heat and mass transfer coefficients of ginger in open sun drying (Case III)	97
4.4.3.1	Convective heat transfer coefficient (h_c)	97
4.4.3.2	Evaporative mass transfer coefficient (h_e)	97
4.4.3.3	Radiative heat transfer coefficient (h_r)	99
4.4.4	Heat and mass transfer coefficients in solar-biomass hybrid drying of turmeric (Case I)	99
4.4.4.1	Convective heat transfer coefficient (h_c)	100
4.4.4.2	Evaporative mass transfer coefficient (h_e)	101
4.4.4.3	Radiative heat transfer coefficient (h_r)	101
4.4.5	Heat and mass transfer coefficients in solar drying of turmeric (Case II)	103
4.4.5.1	Convective heat transfer coefficient (h_c)	103
4.4.5.2	Evaporative mass transfer coefficient (h_e)	104
4.4.5.3	Radiative heat transfer coefficient (h_r)	104
4.4.6	Heat and mass transfer coefficients in open sun drying of turmeric (Case III)	105
4.4.6.1	Convective heat transfer coefficient (h_c)	105
4.4.6.2	Evaporative mass transfer coefficient (h_e)	107
4.4.6.3	Radiative heat transfer coefficient (h_r)	107
4.4.7	Comparison of heat and mass transfer coefficients of ginger and turmeric in different cases	108
4.4.8	Heat and mass transfer coefficients at different tray levels	111
4.5	Determination of Per Cent Uncertainty	112
4.5.1	Internal uncertainty	112
4.5.2	External uncertainty	113
4.6	Determination of Thermal Efficiency under Different Modes of Drying	115
4.6.1	Overall thermal efficiency in solar-biomass drying of ginger (Case I)	115
4.6.2	Overall thermal efficiency in solar drying of ginger (Case II)	117
4.6.3	Overall thermal efficiency in open sun drying of ginger (Case III)	117
4.6.4	Comparison of overall thermal efficiency under the three modes of drying of ginger	118
4.6.5	Overall thermal efficiency in solar-biomass drying of turmeric (Case I)	119
4.6.6	Overall thermal efficiency in solar drying of turmeric (Case II)	120
4.6.7	Overall thermal efficiency in open sun drying of turmeric (Case III)	120
4.6.8	Comparison of overall thermal efficiency under the three modes of drying of turmeric	121
4.6.9	Effect of thickness, treatment, climatic conditions on overall thermal efficiency under different modes of drying	122
4.7	Functional Parameters of the Solar-Biomass Hybrid Drier	123
4.7.1	Thermal storage effect of rock slab	124
4.7.2	Heat loss through drying cabinet	125
4.7.3	Individual heating effect of solar and biomass energy	125

4.8	Quality Analysis of the Dried Products	129
4.8.1	Physical appearance of the dried products	129
4.8.2	Volatile oil content of ginger in solar-biomass hybrid drying (Case I)	129
4.8.3	Volatile oil content of ginger in solar drying (Case II)	131
4.8.4	Volatile oil content of ginger in open sun drying (Case III)	131
4.8.5	Volatile oil content of turmeric in solar-biomass hybrid drying (Case I)	132
4.8.6	Volatile oil content of turmeric in solar drying (Case II)	133
4.8.7	Volatile oil of turmeric in open sun drying (Case III)	134
4.8.8	Effect of thickness, treatment, climatic condition on volatile oil content under different modes of drying	135
4.8.9	Other quality parameters of ginger and turmeric	136
4.9	Cost Economic Analysis	138
4.9.1	Economic parameters	138
4.9.1.1	Analysis of economic viability	138
4.9.1.2	Net present value and internal rate of return of the system	139
4.9.1.3	Benefit-cost ratio and payback period of the system	139
4.9.2	Economical aspects	140
4.9.2.1	Annual input cost	141
4.9.2.2	Net annual saving	142
4.9.2.3	Payback period	142
4.9.3	Variation of the payback period	143
4.10	Feasibility of Entrepreneurship Development	144
