

**RADIATION INDUCED HYDROPHILIC POLYMERS
FOR BIOMEDICAL APPLICATIONS**

by
HARPAL SINGH
Centre for Biomedical Engineering

thesis submitted in fulfilment of the requirements of the degree of
DOCTOR OF PHILOSOPHY
to the Indian Institute of Technology, Delhi

Department of Textile Technology
Indian Institute of Technology, Delhi
September, 1981

CERTIFICATE

This is to certify that the thesis entitled
'RADIATION INDUCED HYDROPHILIC POLYMERS FOR BIOMEDICAL
APPLICATIONS'' being submitted by Mr. Harpal Singh to
the Indian Institute of Technology, Delhi for the award
of the Degree of DOCTOR OF PHILOSOPHY in the Department
of Textile Technology, is a record of bonafide research
carried out by him. Mr. Harpal Singh has worked under
our guidance and supervision and has fulfilled the
requirements for the submission of the thesis.

The results contained in this thesis have not
been submitted, in part or in full, to any other
University or Institute for the award of any degree
or diploma.

A C K N O W L E D G E M E N T S

I wish to express my deep sense of gratitude to Dr. (Mrs.) P. Vasudevan and Dr. A.R. Ray under whose constant encouragement this work has been possible. I thank Prof. S.K. Guha and Prof. S.N. Tandon for providing me the laboratory and other facilities at the Centre for Biomedical Engineering, Indian Institute of Technology, Delhi and All India Institute of Medical Sciences (AIIMS), Delhi.

Prof. P.C. Kesvan and Prof. P. Mohanty have helped me by permitting me to avail of the ^{60}Co - γ radiation facilities at Jawaharlal Nehru University, Delhi. Mr. Alexander and Mr. Khan of the School of Life Sciences, J.N.U. have taken a great deal of trouble in carrying out the irradiation of the samples. My sincere thanks to them for their constant help.

I sincerely thank Dr. Indra Nath, Assistant Prof., Department of Pathology, AIIMS for helping me in evaluating the biocompatibility of modified and unmodified polyvinyl chloride samples. I also thank Prof. Kusum Verma, Department of Pathology, AIIMS for her help in vas deferens histopathological studies.

I would like to thank Prof. N. Gopinath, Head, Department of Cardiothoracic Surgery for providing me medical grade polyvinyl chloride (Polystan, Denmark)

samples. I am indebted to Prof. L.N. Mahapatra, Head, Microbiology, A.I.I.M.S. for providing me the facilities for microbiological work.

My special thanks are due to Mr. Manjeet Singh Jabbal for his invaluable discussion and help for carrying out biological experiments. It is my pleasure to acknowledge the contribution of Mr. Manmohan Misro in contraceptive studies and of Dr. Kiran Bala in microbiological work. I feel it a pleasure to acknowledge the assistance from technical staff for their cooperation rendered to carry out this work smoothly.

I am unable to express in words the help rendered by Mr. S.N. Garg, Mr. Manjit Singh Dhillion and Mr. Sabu Joseph, in the preparation of the manuscript. It would not have been possible for me to bring this work in the present form without their efforts.

A special word of praise and appreciation is due to members of my family and all friends.

The financial assistance provided for carrying out this work by the Bhabha Atomic Research Centre, Bombay and Council of Scientific and Industrial Research, New Delhi, is gratefully acknowledged.

Singh
(Harpal Singh)

Various methods of preparation of synthetic polymeric hydrogels and their biomedical applications are discussed. Radiation induced hydrophilic copolymers and graft copolymers were synthesised and evaluated for biomedical applications. Specifically the aspects of biocompatibility and applications of hydrogels in sustained delivery of drugs and male fertility control were examined.

In the first part of the thesis a new method of fertility control in male has been proposed and tested in rat as an experimental model. The technique involves the use of polymer which when injected into the vas deferens get precipitated there and lower the pH to kill the spermatozoa passing through it. Poly (hydroxyethylmethacrylate-methacrylic acid) poly(HEMA-MAC), and poly(styrene-maleic anhydride) poly(S-MA) were synthesised for this purpose. Polymers were characterised using viscosity measurements, pH titration and swelling measurements in saline as well as distilled water. The results indicated that MAC content in the poly (HEMA-MAC) copolymers was roughly proportional to the percentage of MAC taken in the HEMA : MAC monomer mixture. Viscosity increased with increasing the MAC content in HEMA-MAC copolymers. In vitro as well as long term in vivo experiments were carried out to assess the contraceptive

action of the polymers. It was found that this method of male fertility control is non-occlusive, reversible and has contraceptive effect upto six months in rats.

In the second part of the thesis, radiation grafting with hydrogels using vinyl monomers was envisaged to increase the biocompatibility as well as heat and ageing resistance of polyvinyl chloride (PVC). Grafting of vinyl monomers onto PVC films and tubes was carried out in different solvents at various dose, dose rate and monomer concentration in nitrogen atmosphere. HEMA, MAC, acrylic acid (AC), and N-vinyl-2-pyrrolidone (NVP) were used as monomers in grafting experiments. Effect of Cu^{++} ions on the grafting efficiency of HEMA, NVP and their different mixtures was also studied in aqueous medium. Graft copolymers were characterized using pH titration, nitrogen estimation, swelling measurements in different media, scanning electron microscopy and thermogravimetric analysis.

It was observed that the grafting percentage was higher at low dose rate and increased with increasing monomer concentration and total dose. With increase in the MAC content in the HEMA-MAC mixture, the percentage grafting also increased. Cu^{++} ions did not have a marked effect on grafting when only HEMA or NVP was used but with the mixture of HEMA-NVP, grafting increased significantly. Thermal stability of PVC increased after grafting with MAC and HEMA.

The tissue and blood compatibility of PVC was found to be increased after grafting with hydrogels. The feasibility of formulating a drug depot for sustained delivery using PVC grafted with functional hydrogels was also examined. It was found that immobilized quaternary ammonium antimicrobial drugs retained their activity against microorganisms and the release was sustained upto 40 days.
