This is to certify that the thesis entitled 'A Microprogram Generating System with Emphasis on Signal Processing Architectures', being submitted by M. BALAKRISHNAN for the award of the degree of Doctor of Philosophy to the Indian Institute of Technology, Delhi, is a record of bonafide research work done by him under our supervision. The results contained therein have not been submitted to any other University or Institute for the award of any degree or diploma .

A C K N O W L E D G E M E N T

It is with deep sense of gratitude that I acknowledge the guidance and encouragement rendered to me by my supervisors, Prof. P.C.P. Bhatt and Dr.B.B. Madan during the course of this work.

It is a pleasure to acknowledge the fruitful association I have had with my colleagues in the signal processing group at CARE. I have had many useful discussions with Dr.Anshul Kumar and Shri Shashi Kumar. I express my sincere thanks to Dr.Surendra Prasad, Dr.Rajendra Bahl, Shri A.L. Vyas and Lt. G.V. Kuriyan who not only cheerfully took extra burden of my responsibilities during the final phase of my work, but also were a source of encouragement. Among other group members, I would specifically like to acknowledge the contribution of Shri R. Kumar, Miss Dolly Saxena and Shri Mohd. Zubair in correcting and preparing this manuscript. A number of graduate students were involved in implementing the signal processing systems and hand coding its control. I express my thanks to them for providing test examples.

I would also like to take this opportunity to express my appreciation to the Department of Electronics, Govt. of India for the support in the form of computing facilities provided at the Centre.

The efficient and prompt typing of this thesis by Mrs.R.K. Mansukhani and tracings made by Shri R.P. Kapoor deserve my special thanks.

And lastly, it is with the deepest sense of gratitude that I acknowledge the care, understanding and constant encouragement, I have received from my parents throughout the course of this work. To them, I dedicate this thesis.

A handwritten signature in dark ink, appearing to read 'M. Bala Krishnan', with a long horizontal flourish extending to the right.

Microprogramming as a design philosophy has been widely accepted for implementing the control section of digital systems. Further, microprogramming has always appeared promising with regard to offering a user control on architectures. However, the development of user microprogramming has been limited by support software. This dissertation is an effort in designing a software package to support user microprogram generation.

The utility of the proposed microprogram generating system (called PRAM) is established by considering three different signal processing architectures. Even though we have chosen the area of signal processing, this package is general enough to be useful for designing any digital system. The hardware design process necessarily involves certain amount of backtracking i.e. redesign and modifications at different stages. Many of these changes are bound to affect the microarchitecture of the system. Thus, if the package is to be useful, it should be retargetable.

The three major components of such a microprogram generating system are

- i. Microprogramming language and translator.
- ii. Microprogram compaction subsystem.
- iii. Microcode simulator.

An extensive survey of microprogramming languages is followed by the design of a language for PRAM. The language provides for a unified syntax to describe target microarchitecture as well as the algorithm to be microprogrammed. Some important features of this language are:

- i. Data transformations to be specified at register transfer level.
- ii. Control flow using PASCAL like branch and loop constructs.
- iii. Low level access for directly assigning microorders.

The translator analyses the microarchitecture declarations to generate all feasible register transfer operations. The source algorithm is then mapped on to the microarchitecture to generate a list of microoperations for the compaction process.

The compaction subsystem uses a modified critical path algorithm to generate microcode. The algorithm implemented achieves local compaction i.e. compaction within a straight line segment. But it has the capability to handle branches and loops, and generates branch addresses automatically.

An interactive microprogram simulator featuring logic state analyser like trace facilities has been designed for hardware design evaluation and microcode validation. The target specific simulation routines can be synthesised from the microarchitecture description.

The dissertation establishes the suitability of PRAM for digital hardware design by generating microcode for, example signal processing systems.

TABLE OF CONTENTS

CHAPTER I

INTRODUCTION

1.1	Microprogramming: An Overview	1
1.2	Microprogramming Software System (MSS): Objectives	4
1.3	Summary	6
1.4	References	11

CHAPTER II

MICROPROGRAM GENERATING SYSTEMS

2.1	Introduction	12
2.2	MSS-Univ. of Kiel, W.Germany	12
2.3	Sheraga and Gieser's Scheme	15
2.4	IMPULSE: Hierarchical microprogram generating system	17
2.5	Microprogram Generating System (MPG)	19
2.6	Some Observations	21
2.7	References	23

CHAPTER III

SIGNAL PROCESSING ARCHITECTURES: CASE STUDIES

3.1	Introduction	24
3.2	Multi-channel FFT Processor	27
3.3	High Speed Digital Convolution	34

3.4	Adaptive MTI Processor	42
3.5	Conclusion	48
3.6	References	51

CHAPTER IV

A MICROPROGRAMMING LANGUAGE

4.1	Introduction	54
4.2	Features of a microprogramming language	55
4.3	Comparison of existing languages	59
4.4	Design of the language for PRAM	64
4.5	PRAM - Translator Implementation	78
4.5.1	Syntax and semantics	78
4.5.2	Generation of Register Transfer Operations	88
4.5.3	Translation	111
4.5.4	Summary of the translator implementation	121
4.6	References	126

CHAPTER V

MICROPROGRAM COMPACTION

5.1	Introduction	130
5.2	Bit Dimension Reduction	131
5.3	Word Dimension Reduction	137

5.4	Survey of Compaction Algorithms	141
5.4.1	Local microprogram compaction	141
5.4.2	Global Microcode Compaction	143
5.5	Critical Path algorithm and its implementation	149
5.6	Conclusion and Results	164
5.7	References	176

CHAPTER VI

MICROPROGRAM SIMULATOR

6.1	Introduction	180
6.2	Retargetable microprogram simulator	181
6.3	Implementation of the simulator	188
6.4	Synthesis of simulation routines	191
6.5	Some Observations	192
6.6	References	195

CHAPTER VII

CONCLUSION	196
Appendix I Terminology and Definitions	199
Appendix II PRAM: BNF Notation	201
Appendix III Test Examples	203
Biographical Note
